meant to be limiting VGAM276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3824] The complementary binding of VGAM276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3825] It is appreciated that VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM276 host target genes. The mRNA of each one of this plurality of VGAM276 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM276 RNA, herein designated VGAM RNA, and which when bound by VGAM276 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM276 host target proteins.

[3826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM276 gene, herein designated VGAM GENE, on one or more VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3827] It is yet further appreciated that a function of VGAM276 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM276 correlate with, and may be deduced from, the identity of the host target genes which VGAM276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3828] Nucleotide sequences of the VGAM276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM276 are further described hereinbelow with reference to Table 1.

[3829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3830] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 277 (VGAM277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3831] VGAM277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM277 was detected is described hereinabove with reference to Figs. 2–8.

[3832] VGAM277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3833] VGAM277 gene, herein designated VGAM GENE, encodes a VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM277 precursor RNA is designated SEQ ID:263, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:263 is located at position 54634 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3834] VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3835] An enzyme complex designated DICER COMPLEX, dices the VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM277 RNA is designated SEQ ID:2988, and

is provided hereinbelow with reference to the sequence listing part.

[3836] VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3837] VGAM277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3838] The complementary binding of VGAM277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3839] It is appreciated that VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM277 host target genes. The mRNA of each one of this plurality of VGAM277 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM277 RNA, herein designated VGAM RNA, and which when bound by VGAM277 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM277 host target proteins.

[3840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM277 gene, herein designated VGAM GENE, on one or more VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3841] It is yet further appreciated that a function of VGAM277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM277 correlate with, and may be deduced from, the identity of the host target genes which VGAM277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3842] Nucleotide sequences of the VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM277 are further described hereinbelow with reference to Table 1.

[3843] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM277 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3844] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 278 (VGAM278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3845] VGAM278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM278 was detected is described hereinabove with reference to Figs. 2–8.

[3846] VGAM278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3847] VGAM278 gene, herein designated VGAM GENE, encodes a VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM278 precursor RNA is

designated SEQ ID:264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:264 is located at position 17046 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3848] VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3849] An enzyme complex designated DICER COMPLEX, dices the VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide se-

quence of VGAM278 RNA is designated SEQ ID:2989, and is provided hereinbelow with reference to the sequence listing part.

[3850] VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3851] VGAM278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3852] The complementary binding of VGAM278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3853] It is appreciated that VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM278 host target genes. The mRNA of

each one of this plurality of VGAM278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM278 RNA, herein designated VGAM RNA, and which when bound by VGAM278 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM278 host target proteins.

[3854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM278 gene, herein designated VGAM GENE, on one or more VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[3855] It is yet further appreciated that a function of VGAM278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM278 correlate with, and may be deduced from, the identity of the host target genes which VGAM278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3856] Nucleotide sequences of the VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM278 are further described hereinbelow with reference to Table 1.

[3857] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM278 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[3858] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 279 (VGAM279) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3859] VGAM279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM279 was detected is described hereinabove with reference to Figs. 2–8.

[3860] VGAM279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3861] VGAM279 gene, herein designated VGAM GENE, encodes a VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM279 precursor RNA is designated SEQ ID:265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:265 is located at position 12207 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3862] VGAM279 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3863] An enzyme complex designated DICER COMPLEX, dices the VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM279 RNA is designated SEQ ID:2990, and is provided hereinbelow with reference to the sequence listing part.

[3864] VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3865] VGAM279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3866] The complementary binding of VGAM279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3867] It is appreciated that VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM279 host target genes. The mRNA of each one of this plurality of VGAM279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM279 RNA, herein designated VGAM RNA, and which when bound by VGAM279 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM279 host target proteins.

[3868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM279 gene, herein designated VGAM GENE, on one or more VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[3869] It is yet further appreciated that a function of VGAM279 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM279 correlate with, and may be deduced from, the identity of the host target genes which VGAM279 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3870] Nucleotide sequences of the VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM279 are further described hereinbelow with reference to Table 1.

[3871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3872] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 280 (VGAM280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3873] VGAM280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM280 was detected is described hereinabove with reference to Figs. 2–8.

[3874] VGAM280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3875] VGAM280 gene, herein designated VGAM GENE, encodes a VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM280 precursor RNA is designated SEQ ID:266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:266 is located at position 110345 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3876] VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3877] An enzyme complex designated DICER COMPLEX, dices the VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM280 RNA is designated SEQ ID:2991, and is provided hereinbelow with reference to the sequence listing part.

[3878] VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3879] VGAM280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3880] The complementary binding of VGAM280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3881] It is appreciated that VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM280 host target genes. The mRNA of each one of this plurality of VGAM280 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM280 RNA, herein designated VGAM RNA, and which when bound by VGAM280 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM280 host target proteins.

[3882] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM280 gene, herein designated VGAM GENE, on one or more VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3883] It is yet further appreciated that a function of VGAM280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM280 correlate with, and may be deduced from, the identity of the host target genes which VGAM280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3884] Nucleotide sequences of the VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM280 are further described hereinbelow with reference to Table 1.

[3885] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3886] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 281 (VGAM281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3887] VGAM281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM281 was detected is described hereinabove with reference to Figs. 2–8.

[3888] VGAM281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3889] VGAM281 gene, herein designated VGAM GENE, encodes a VGAM281 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM281 precursor RNA is designated SEQ ID:267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:267 is located at position 83939 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3890] VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3891] An enzyme complex designated DICER COMPLEX, dices the VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM281 RNA is designated SEQ ID:2992, and is provided hereinbelow with reference to the sequence listing part.

[3892] VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3893] VGAM281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM281 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3894] The complementary binding of VGAM281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[3895] It is appreciated that VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM281 host target genes. The mRNA of each one of this plurality of VGAM281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM281 RNA, herein designated VGAM RNA, and which when bound by VGAM281 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM281 host target proteins.

[3896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM281 gene, herein designated VGAM GENE, on one or more VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3897] It is yet further appreciated that a function of VGAM281 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM281 correlate with, and may be deduced from, the identity of the host target genes which VGAM281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3898] Nucleotide sequences of the VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM281 are further described hereinbelow with reference to Table 1.

[3899] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3900] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 282 (VGAM282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3901] VGAM282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM282 was detected is described hereinabove with reference to Figs. 2-8.

[3902] VGAM282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3903] VGAM282 gene, herein designated VGAM GENE, encodes a VGAM282 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM282 precursor RNA is designated SEQ ID:268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:268 is located at position 78903 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3904] VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3905] An enzyme complex designated DICER COMPLEX, dices the VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM282 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM282 RNA is designated SEQ ID:2993, and is provided hereinbelow with reference to the sequence listing part.

[3906] VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3907] VGAM282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM282 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3908] The complementary binding of VGAM282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM282 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3909] It is appreciated that VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM282 host target genes. The mRNA of each one of this plurality of VGAM282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM282 RNA, herein designated VGAM RNA, and which when bound by VGAM282 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM282 host target proteins.

[3910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM282 gene, herein designated VGAM GENE, on one or more VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3911] It is yet further appreciated that a function of VGAM282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM282 correlate with, and may be deduced from, the identity of the host target genes which VGAM282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3912] Nucleotide sequences of the VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM282 are further described hereinbelow with reference to Table 1.

[3913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3914] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 283 (VGAM283) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3915] VGAM283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM283 was detected is described hereinabove with reference to Figs. 2-8.

[3916] VGAM283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3917] VGAM283 gene, herein designated VGAM GENE, encodes a

VGAM283 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM283 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM283 precursor RNA is designated SEQ ID:269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:269 is located at position 1023 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3918] VGAM283 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3919] An enzyme complex designated DICER COMPLEX, dices the VGAM283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM283 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM283 RNA is designated SEQ ID:2994, and is provided hereinbelow with reference to the sequence listing part.

[3920] VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3921] VGAM283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM283 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3922] The complementary binding of VGAM283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3923] It is appreciated that VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM283 host target genes. The mRNA of each one of this plurality of VGAM283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM283 RNA, herein designated VGAM RNA, and which when bound by VGAM283 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM283 host target proteins.

[3924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM283 gene, herein designated VGAM GENE, on one or more VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3925] It is yet further appreciated that a function of VGAM283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM283 correlate with, and may be deduced from, the identity of the host target genes which VGAM283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3926] Nucleotide sequences of the VGAM283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM283 are further de-

scribed hereinbelow with reference to Table 1.

[3927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3928] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 284 (VGAM284) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3929] VGAM284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM284 was detected is described hereinabove with reference to Figs. 2-8.

[3930] VGAM284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3931] VGAM284 gene, herein designated VGAM GENE, encodes a VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM284 precursor RNA is designated SEQ ID:270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:270 is located at position 5957 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3932] VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3933] An enzyme complex designated DICER COMPLEX, dices the VGAM284 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM284 RNA is designated SEQ ID:2995, and is provided hereinbelow with reference to the sequence listing part.

[3934] VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3935] VGAM284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM284 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3936] The complementary binding of VGAM284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM284 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3937] It is appreciated that VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM284 host target genes. The mRNA of each one of this plurality of VGAM284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM284 RNA, herein designated VGAM RNA, and which when bound by VGAM284 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM284 host target proteins.

[3938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM284 gene, herein designated VGAM GENE, on one or more VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3939] It is yet further appreciated that a function of VGAM284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM284 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM284 correlate with, and may be deduced from, the identity of the host target genes which VGAM284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3940] Nucleotide sequences of the VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM284 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM284 are further described hereinbelow with reference to Table 1.

[3941] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3942] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 285 (VGAM285) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3943] VGAM285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM285 was detected is described hereinabove with reference to Figs. 2-8.

[3944] VGAM285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[3945] VGAM285 gene, herein designated VGAM GENE, encodes a VGAM285 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM285 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM285 precursor RNA is designated SEQ ID:271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:271 is located at position 58647 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3946] VGAM285 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3947] An enzyme complex designated DICER COMPLEX, dices

the VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM285 RNA is designated SEQ ID:2996, and is provided hereinbelow with reference to the sequence listing part.

[3948] VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3949] VGAM285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM285 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3950] The complementary binding of VGAM285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3951] It is appreciated that VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM285 host target genes. The mRNA of each one of this plurality of VGAM285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM285 RNA, herein designated VGAM RNA, and which when bound by VGAM285 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM285 host target proteins.

[3952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM285 gene, herein designated VGAM GENE, on one or more VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3953] It is yet further appreciated that a function of VGAM285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM285 correlate with, and may be deduced from, the identity of the host target genes which VGAM285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3954] Nucleotide sequences of the VGAM285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM285 are further described hereinbelow with reference to Table 1.

[3955] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3956] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 286 (VGAM286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3957] VGAM286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM286 was detected is described hereinabove with reference to Figs. 2-8.

[3958] VGAM286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM286 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

- [3959] VGAM286 gene, herein designated VGAM GENE, encodes a VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM286 precursor RNA is designated SEQ ID:272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:272 is located at position 4528 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.
- [3960] VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3961] An enzyme complex designated DICER COMPLEX, dices the VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM286 RNA is designated SEQ ID:2997, and is provided hereinbelow with reference to the sequence listing part.

[3962] VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3963] VGAM286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3964] The complementary binding of VGAM286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM286 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3965] It is appreciated that VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM286 host target genes. The mRNA of each one of this plurality of VGAM286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM286 RNA, herein designated VGAM RNA, and which when bound by VGAM286 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM286 host target proteins.

[3966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM286 gene, herein designated VGAM GENE, on one or more VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3967] It is yet further appreciated that a function of VGAM286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM286 correlate with, and may be deduced from, the identity of the host target genes which VGAM286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3968] Nucleotide sequences of the VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM286 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM286 are further described hereinbelow with reference to Table 1.

[3969] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3970] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 287 (VGAM287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3971] VGAM287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM287 was detected is described hereinabove with reference to Figs. 2-8.

[3972] VGAM287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Epiphyas postvittana* nu-

cleopolyhedrovirus. VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3973] VGAM287 gene, herein designated VGAM GENE, encodes a VGAM287 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM287 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM287 precursor RNA is designated SEQ ID:273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:273 is located at position 89234 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3974] VGAM287 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[3975] An enzyme complex designated DICER COMPLEX, dices the VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM287 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM287 RNA is designated SEQ ID:2998, and is provided hereinbelow with reference to the sequence listing part.

[3976] VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3977] VGAM287 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM287 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3978] The complementary binding of VGAM287 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3979] It is appreciated that VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM287 host target genes. The mRNA of each one of this plurality of VGAM287 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM287 RNA, herein designated VGAM RNA, and which when bound by VGAM287 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM287 host target proteins.

[3980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM287 gene, herein designated VGAM GENE, on one or more VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3981] It is yet further appreciated that a function of VGAM287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM287 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM287 correlate with, and may be deduced from, the identity of the host target genes which VGAM287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3982] Nucleotide sequences of the VGAM287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM287 are further described hereinbelow with reference to Table 1.

[3983] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM287 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3984] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 288 (VGAM288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3985] VGAM288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM288 was detected is described hereinabove with reference to Figs. 2-8.

[3986] VGAM288 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3987] VGAM288 gene, herein designated VGAM GENE, encodes a VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM288 precursor RNA is designated SEQ ID:274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:274 is located at position 54105 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[3988] VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3989] An enzyme complex designated DICER COMPLEX, dices the VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM288 RNA is designated SEQ ID:2999, and is provided hereinbelow with reference to the sequence listing part.

[3990] VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[3991] VGAM288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[3992] The complementary binding of VGAM288 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3993] It is appreciated that VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM288 host target genes. The mRNA of each one of this plurality of VGAM288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM288 RNA, herein designated VGAM RNA, and which when bound by VGAM288 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM288 host target proteins.

[3994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM288 gene, herein designated VGAM GENE, on one or more VGAM288 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[3995] It is yet further appreciated that a function of VGAM288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM288 correlate with, and may be deduced from, the identity of the host target genes which VGAM288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3996] Nucleotide sequences of the VGAM288 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM288 are further described hereinbelow with reference to Table 1.

[3997] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3998] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 289 (VGAM289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3999] VGAM289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM289 was detected is described hereinabove with reference to Figs. 2-8.

[4000] VGAM289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4001] VGAM289 gene, herein designated VGAM GENE, encodes a VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM289 precursor RNA is designated SEQ ID:275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:275 is located at position 113982 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4002] VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4003] An enzyme complex designated DICER COMPLEX, dices the VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM289 RNA is designated SEQ ID:3000, and is provided hereinbelow with reference to the sequence listing part.

[4004] VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4005] VGAM289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM289 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[4006] The complementary binding of VGAM289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4007] It is appreciated that VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM289 host target genes. The mRNA of each one of this plurality of VGAM289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM289 RNA, herein designated VGAM RNA, and which when bound by VGAM289 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM289 host target proteins.

[4008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM289 gene, herein designated VGAM GENE, on one or more VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4009] It is yet further appreciated that a function of VGAM289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM289 correlate with, and may be deduced from, the identity of the host target genes which VGAM289 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[4010] Nucleotide sequences of the VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM289 are further described hereinbelow with reference to Table 1.

[4011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4012] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 290 (VGAM290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4013] VGAM290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM290 was detected is described hereinabove with reference to Figs. 2–8.

[4014] VGAM290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4015] VGAM290 gene, herein designated VGAM GENE, encodes a VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM290 precursor RNA is designated SEQ ID:276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:276 is located at position 108012 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4016] VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4017] An enzyme complex designated DICER COMPLEX, dices the VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM290 RNA is designated SEQ ID:3001, and is provided hereinbelow with reference to the sequence listing part.

[4018] VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4019] VGAM290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4020] The complementary binding of VGAM290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4021] It is appreciated that VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM290 host target genes. The mRNA of each one of this plurality of VGAM290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM290 RNA, herein designated VGAM RNA, and which when bound by VGAM290 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM290 host target proteins.

[4022] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM290 gene, herein designated VGAM GENE, on one or more VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4023] It is yet further appreciated that a function of VGAM290 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM290 correlate with, and may be deduced

from, the identity of the host target genes which VGAM290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4024] Nucleotide sequences of the VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM290 are further described hereinbelow with reference to Table 1.

[4025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4026] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 291 (VGAM291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4027] VGAM291 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM291 was detected is described hereinabove with reference to Figs. 2–8.

[4028] VGAM291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4029] VGAM291 gene, herein designated VGAM GENE, encodes a VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM291 precursor RNA is designated SEQ ID:277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:277 is located at position 95193 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4030] VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM291 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4031] An enzyme complex designated DICER COMPLEX, dices the VGAM291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM291 RNA is designated SEQ ID:3002, and is provided hereinbelow with reference to the sequence listing part.

[4032] VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM291 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4033] VGAM291 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4034] The complementary binding of VGAM291 RNA, herein designated VGAM RNA, to host target binding sites on VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4035] It is appreciated that VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM291 host target genes. The mRNA of each one of this plurality of VGAM291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM291 RNA, herein designated VGAM RNA, and which when bound by VGAM291 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM291 host target proteins.

[4036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM291 gene, herein designated VGAM GENE, on one or more VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4037] It is yet further appreciated that a function of VGAM291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utili-

ties, of VGAM291 correlate with, and may be deduced from, the identity of the host target genes which VGAM291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4038] Nucleotide sequences of the VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM291 are further described hereinbelow with reference to Table 1.

[4039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4040] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 292 (VGAM292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[4041] VGAM292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM292 was detected is described hereinabove with reference to Figs. 2–8.

[4042] VGAM292 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4043] VGAM292 gene, herein designated VGAM GENE, encodes a VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM292 precursor RNA is designated SEQ ID:278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:278 is located at position 9896 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4044] VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM292 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4045] An enzyme complex designated DICER COMPLEX, dices the VGAM292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM292 RNA is designated SEQ ID:3003, and is provided hereinbelow with reference to the sequence listing part.

[4046] VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM292 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4047] VGAM292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4048] The complementary binding of VGAM292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4049] It is appreciated that VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM292 host target genes. The mRNA of each one of this plurality of VGAM292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM292 RNA, herein designated VGAM RNA, and which when bound by VGAM292 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM292 host target proteins.

[4050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM292 gene, herein designated VGAM GENE, on one or more VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4051] It is yet further appreciated that a function of VGAM292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucle-

opolyhedrovirus. Specific functions, and accordingly utilities, of VGAM292 correlate with, and may be deduced from, the identity of the host target genes which VGAM292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4052] Nucleotide sequences of the VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM292 are further described hereinbelow with reference to Table 1.

[4053] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4054] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 293 (VGAM293) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[4055] VGAM293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM293 was detected is described hereinabove with reference to Figs. 2–8.

[4056] VGAM293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4057] VGAM293 gene, herein designated VGAM GENE, encodes a VGAM293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM293 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM293 precursor RNA is designated SEQ ID:279, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:279 is located at position 23397 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4058] VGAM293 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4059] An enzyme complex designated DICER COMPLEX, dices the VGAM293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM293 RNA is designated SEQ ID:3004, and is provided hereinbelow with reference to the sequence listing part.

[4060] VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4061] VGAM293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM293 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4062] The complementary binding of VGAM293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4063] It is appreciated that VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM293 host target genes. The mRNA of each one of this plurality of VGAM293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM293 RNA, herein designated VGAM RNA, and which when bound by VGAM293 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM293 host target proteins.

[4064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM293 gene, herein designated VGAM GENE, on one or more VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4065] It is yet further appreciated that a function of VGAM293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM293 include diagnosis, prevention and

treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM293 correlate with, and may be deduced from, the identity of the host target genes which VGAM293 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4066] Nucleotide sequences of the VGAM293 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM293 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM293 are further described hereinbelow with reference to Table 1.

[4067] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM293 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4068] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 294 (VGAM294) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4069] VGAM294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM294 was detected is described hereinabove with reference to Figs. 2–8.

[4070] VGAM294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4071] VGAM294 gene, herein designated VGAM GENE, encodes a VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM294 precursor RNA is designated SEQ ID:280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:280 is located at position 77095 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4072] VGAM294 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4073] An enzyme complex designated DICER COMPLEX, dices the VGAM294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM294 RNA is designated SEQ ID:3005, and is provided hereinbelow with reference to the sequence listing part.

[4074] VGAM294 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4075] VGAM294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM294 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4076] The complementary binding of VGAM294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4077] It is appreciated that VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM294 host target genes. The mRNA of each one of this plurality of VGAM294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM294 RNA, herein designated VGAM

RNA, and which when bound by VGAM294 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM294 host target proteins.

[4078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM294 gene, herein designated VGAM GENE, on one or more VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4079] It is yet further appreciated that a function of VGAM294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM294 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM294 correlate with, and may be deduced from, the identity of the host target genes which VGAM294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4080] Nucleotide sequences of the VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM294 are further described hereinbelow with reference to Table 1.

[4081] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4082] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 295 (VGAM295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4083] VGAM295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM295 was detected is described hereinabove with reference to Figs. 2–8.

[4084] VGAM295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4085] VGAM295 gene, herein designated VGAM GENE, encodes a VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM295 precursor RNA is designated SEQ ID:281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:281 is located at position 83820 relative to

the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4086] VGAM295 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4087] An enzyme complex designated DICER COMPLEX, dices the VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM295 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM295 RNA is designated SEQ ID:3006, and is provided hereinbelow with reference to the sequence listing part.

[4088] VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4089] VGAM295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM295 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4090] The complementary binding of VGAM295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4091] It is appreciated that VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM295 host target genes. The mRNA of each one of this plurality of VGAM295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM295 RNA, herein designated VGAM RNA, and which when bound by VGAM295 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM295 host target proteins.

[4092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM295 gene, herein designated VGAM GENE, on one or more VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4093] It is yet further appreciated that a function of VGAM295 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM295 correlate with, and may be deduced from, the identity of the host target genes which VGAM295 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4094] Nucleotide sequences of the VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM295 are further described hereinbelow with reference to Table 1.

[4095] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4096] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 296 (VGAM296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4097] VGAM296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM296 was detected is described hereinabove with reference to Figs. 2-8.

[4098] VGAM296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4099] VGAM296 gene, herein designated VGAM GENE, encodes a

VGAM296 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM296 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM296 precursor RNA is designated SEQ ID:282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:282 is located at position 80889 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4100] VGAM296 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4101] An enzyme complex designated DICER COMPLEX, dices the VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM296 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM296 RNA is designated SEQ ID:3007, and is provided hereinbelow with reference to the sequence listing part.

[4102] VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4103] VGAM296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM296 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4104] The complementary binding of VGAM296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4105] It is appreciated that VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM296 host target genes. The mRNA of each one of this plurality of VGAM296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM296 RNA, herein designated VGAM RNA, and which when bound by VGAM296 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM296 host target proteins.

[4106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM296 gene, herein designated VGAM GENE, on one or more VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4107] It is yet further appreciated that a function of VGAM296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM296 correlate with, and may be deduced from, the identity of the host target genes which VGAM296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4108] Nucleotide sequences of the VGAM296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM296 are further de-

scribed hereinbelow with reference to Table 1.

[4109] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4110] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 297 (VGAM297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4111] VGAM297 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM297 was detected is described hereinabove with reference to Figs. 2-8.

[4112] VGAM297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4113] VGAM297 gene, herein designated VGAM GENE, encodes a VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM297 precursor RNA is designated SEQ ID:283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:283 is located at position 88463 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4114] VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4115] An enzyme complex designated DICER COMPLEX, dices the VGAM297 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM297 RNA is designated SEQ ID:3008, and is provided hereinbelow with reference to the sequence listing part.

[4116] VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4117] VGAM297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4118] The complementary binding of VGAM297 RNA, herein designated VGAM RNA, to host target binding sites on VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM297 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4119] It is appreciated that VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM297 host target genes. The mRNA of each one of this plurality of VGAM297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM297 RNA, herein designated VGAM RNA, and which when bound by VGAM297 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM297 host target proteins.

[4120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM297 gene, herein designated VGAM GENE, on one or more VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4121] It is yet further appreciated that a function of VGAM297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM297 correlate with, and may be deduced from, the identity of the host target genes which VGAM297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4122] Nucleotide sequences of the VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM297 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM297 are further described hereinbelow with reference to Table 1.

[4123] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4124] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 298 (VGAM298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4125] VGAM298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM298 was detected is described hereinabove with reference to Figs. 2-8.

[4126] VGAM298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[4127] VGAM298 gene, herein designated VGAM GENE, encodes a VGAM298 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM298 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM298 precursor RNA is designated SEQ ID:284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:284 is located at position 29595 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4128] VGAM298 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4129] An enzyme complex designated DICER COMPLEX, dices

the VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM298 RNA is designated SEQ ID:3009, and is provided hereinbelow with reference to the sequence listing part.

[4130] VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4131] VGAM298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM298 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4132] The complementary binding of VGAM298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4133] It is appreciated that VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM298 host target genes. The mRNA of each one of this plurality of VGAM298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM298 RNA, herein designated VGAM RNA, and which when bound by VGAM298 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM298 host target proteins.

[4134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM298 gene, herein designated VGAM GENE, on one or more VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4135] It is yet further appreciated that a function of VGAM298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM298 correlate with, and may be deduced from, the identity of the host target genes which VGAM298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4136] Nucleotide sequences of the VGAM298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM298 are further described hereinbelow with reference to Table 1.

[4137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4138] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 299 (VGAM299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4139] VGAM299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM299 was detected is described hereinabove with reference to Figs. 2-8.

[4140] VGAM299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM299 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

- [4141] VGAM299 gene, herein designated VGAM GENE, encodes a VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM299 precursor RNA is designated SEQ ID:285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:285 is located at position 59096 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.
- [4142] VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4143] An enzyme complex designated DICER COMPLEX, dices the VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM299 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM299 RNA is designated SEQ ID:3010, and is provided hereinbelow with reference to the sequence listing part.

[4144] VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4145] VGAM299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4146] The complementary binding of VGAM299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM299 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4147] It is appreciated that VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM299 host target genes. The mRNA of each one of this plurality of VGAM299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM299 RNA, herein designated VGAM RNA, and which when bound by VGAM299 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM299 host target proteins.

[4148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM299 gene, herein designated VGAM GENE, on one or more VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4149] It is yet further appreciated that a function of VGAM299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM299 correlate with, and may be deduced from, the identity of the host target genes which VGAM299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4150] Nucleotide sequences of the VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM299 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM299 are further described hereinbelow with reference to Table 1.

[4151] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4152] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 300 (VGAM300) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4153] VGAM300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM300 was detected is described hereinabove with reference to Figs. 2-8.

[4154] VGAM300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Epiphyas postvittana* nu-

cleopolyhedrovirus. VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4155] VGAM300 gene, herein designated VGAM GENE, encodes a VGAM300 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM300 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM300 precursor RNA is designated SEQ ID:286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:286 is located at position 99030 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4156] VGAM300 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

- [4157] An enzyme complex designated DICER COMPLEX, dices the VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM300 RNA is designated SEQ ID:3011, and is provided hereinbelow with reference to the sequence listing part.
- [4158] VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [4159] VGAM300 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4160] The complementary binding of VGAM300 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4161] It is appreciated that VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM300 host target genes. The mRNA of each one of this plurality of VGAM300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM300 RNA, herein designated VGAM RNA, and which when bound by VGAM300 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM300 host target proteins.

[4162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM300 gene, herein designated VGAM GENE, on one or more VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4163] It is yet further appreciated that a function of VGAM300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM300 correlate with, and may be deduced from, the identity of the host target genes which VGAM300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4164] Nucleotide sequences of the VGAM300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM300 are further described hereinbelow with reference to Table 1.

[4165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4166] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 301 (VGAM301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4167] VGAM301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM301 was detected is described hereinabove with reference to Figs. 2-8.

[4168] VGAM301 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4169] VGAM301 gene, herein designated VGAM GENE, encodes a VGAM301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM301 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM301 precursor RNA is designated SEQ ID:287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:287 is located at position 49379 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4170] VGAM301 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4171] An enzyme complex designated DICER COMPLEX, dices the VGAM301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM301 RNA is designated SEQ ID:3012, and is provided hereinbelow with reference to the sequence listing part.

[4172] VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4173] VGAM301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4174] The complementary binding of VGAM301 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4175] It is appreciated that VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM301 host target genes. The mRNA of each one of this plurality of VGAM301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM301 RNA, herein designated VGAM RNA, and which when bound by VGAM301 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM301 host target proteins.

[4176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM301 gene, herein designated VGAM GENE, on one or more VGAM301 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4177] It is yet further appreciated that a function of VGAM301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM301 correlate with, and may be deduced from, the identity of the host target genes which VGAM301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4178] Nucleotide sequences of the VGAM301 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM301 are further described hereinbelow with reference to Table 1.

[4179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM301 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4180] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 302 (VGAM302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4181] VGAM302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM302 was detected is described hereinabove with reference to Figs. 2-8.

[4182] VGAM302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4183] VGAM302 gene, herein designated VGAM GENE, encodes a VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM302 precursor RNA is designated SEQ ID:288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:288 is located at position 66246 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4184] VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4185] An enzyme complex designated DICER COMPLEX, dices the VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM302 RNA is designated SEQ ID:3013, and is provided hereinbelow with reference to the sequence listing part.

[4186] VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[4187] VGAM302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4188] The complementary binding of VGAM302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4189] It is appreciated that VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM302 host target genes. The mRNA of each one of this plurality of VGAM302 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM302 RNA, herein designated VGAM RNA, and which when bound by VGAM302 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM302 host target proteins.

[4190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM302 gene, herein designated VGAM GENE, on one or

more VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4191] It is yet further appreciated that a function of VGAM302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM302 correlate with, and may be deduced from, the identity of the host target genes which VGAM302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4192] Nucleotide sequences of the VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM302 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM302 are further described hereinbelow with reference to Table 1.

[4193] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4194] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 303 (VGAM303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4195] VGAM303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM303 was detected is described

hereinabove with reference to Figs. 2–8.

[4196] VGAM303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas postvittana nucleopolyhedrovirus. VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4197] VGAM303 gene, herein designated VGAM GENE, encodes a VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM303 precursor RNA is designated SEQ ID:289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:289 is located at position 103301 relative to the genome of Epiphyas postvittana nucleopolyhedrovirus.

[4198] VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4199] An enzyme complex designated DICER COMPLEX, dices the VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM303 RNA is designated SEQ ID:3014, and is provided hereinbelow with reference to the sequence listing part.

[4200] VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4201] VGAM303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM303 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4202] The complementary binding of VGAM303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM303 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4203] It is appreciated that VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM303 host target genes. The mRNA of each one of this plurality of VGAM303 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM303 RNA, herein designated VGAM RNA, and which when bound by VGAM303 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM303 host target proteins.

[4204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM303 gene, herein designated VGAM GENE, on one or more VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4205] It is yet further appreciated that a function of VGAM303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of viral infection by Epiphyas postvittana nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM303 correlate with, and may be deduced from, the identity of the host target genes which

VGAM303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4206] Nucleotide sequences of the VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM303 are further described hereinbelow with reference to Table 1.

[4207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4208] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 304 (VGAM304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4209] VGAM304 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM304 was detected is described hereinabove with reference to Figs. 2–8.

[4210] VGAM304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4211] VGAM304 gene, herein designated VGAM GENE, encodes a VGAM304 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM304 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM304 precursor RNA is designated SEQ ID:290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:290 is located at position 86184 relative to the genome of Equine herpesvirus 4.

[4212] VGAM304 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4213] An enzyme complex designated DICER COMPLEX, dices the VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM304 RNA is designated SEQ ID:3015, and is provided hereinbelow with reference to the sequence listing part.

[4214] VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4215] VGAM304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM304 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4216] The complementary binding of VGAM304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4217] It is appreciated that VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM304 host target genes. The mRNA of each one of this plurality of VGAM304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM304 RNA, herein designated VGAM RNA, and which when bound by VGAM304 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM304 host target proteins.

[4218] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM304 gene, herein designated VGAM GENE, on one or more VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4219] It is yet further appreciated that a function of VGAM304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM304 correlate with, and may be deduced from, the identity of the

host target genes which VGAM304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4220] Nucleotide sequences of the VGAM304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM304 are further described hereinbelow with reference to Table 1.

[4221] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4222] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 305 (VGAM305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4223] VGAM305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM305 was detected is described hereinabove with reference to Figs. 2–8.

[4224] VGAM305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4225] VGAM305 gene, herein designated VGAM GENE, encodes a VGAM305 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM305 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM305 precursor RNA is designated SEQ ID:291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:291 is located at position 85065 relative to the genome of Equine herpesvirus 4.

[4226] VGAM305 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4227] An enzyme complex designated DICER COMPLEX, dices the VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM305 RNA is designated SEQ ID:3016, and is provided hereinbelow with reference to the sequence listing part.

[4228] VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM305 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4229] VGAM305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4230] The complementary binding of VGAM305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4231] It is appreciated that VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM305 host target genes. The mRNA of each one of this plurality of VGAM305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM305 RNA, herein designated VGAM RNA, and which when bound by VGAM305 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM305 host target proteins.

[4232] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM305 gene, herein designated VGAM GENE, on one or more VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4233] It is yet further appreciated that a function of VGAM305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM305 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4234] Nucleotide sequences of the VGAM305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM305 are further described hereinbelow with reference to Table 1.

[4235] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4236] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 306 (VGAM306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[4237] VGAM306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM306 was detected is described hereinabove with reference to Figs. 2–8.

[4238] VGAM306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4239] VGAM306 gene, herein designated VGAM GENE, encodes a VGAM306 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM306 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM306 precursor RNA is designated SEQ ID:292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:292 is located at position 87168 relative to the genome of Equine herpesvirus 4.

[4240] VGAM306 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM306 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4241] An enzyme complex designated DICER COMPLEX, dices the VGAM306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM306 RNA is designated SEQ ID:3017, and is provided hereinbelow with reference to the sequence listing part.

[4242] VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM306 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4243] VGAM306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4244] The complementary binding of VGAM306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4245] It is appreciated that VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM306 host target genes. The mRNA of each one of this plurality of VGAM306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM306 RNA, herein designated VGAM RNA, and which when bound by VGAM306 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM306 host target proteins.

[4246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM306 gene, herein designated VGAM GENE, on one or more VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4247] It is yet further appreciated that a function of VGAM306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM306 correlate with, and may be deduced from, the identity of the host target genes which VGAM306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4248] Nucleotide sequences of the VGAM306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM306 are further described hereinbelow with reference to Table 1.

[4249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4250] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 307 (VGAM307) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[4251] VGAM307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM307 was detected is described hereinabove with reference to Figs. 2–8.

[4252] VGAM307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4253] VGAM307 gene, herein designated VGAM GENE, encodes a VGAM307 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM307 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM307 precursor RNA is designated SEQ ID:293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:293 is located at position 1062 relative to the genome of Human adenovirus E.

[4254] VGAM307 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4255] An enzyme complex designated DICER COMPLEX, dices the VGAM307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM307 RNA is designated SEQ ID:3018, and is provided hereinbelow with reference to the sequence listing part.

[4256] VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4257] VGAM307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM307 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4258] The complementary binding of VGAM307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4259] It is appreciated that VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM307 host target genes. The mRNA of each one of this plurality of VGAM307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM307 RNA, herein designated VGAM RNA, and which when bound by VGAM307 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM307 host target proteins.

[4260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM307 gene, herein designated VGAM GENE, on one or more VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4261] It is yet further appreciated that a function of VGAM307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM307 include diagnosis, prevention and

treatment of viral infection by Human adenovirus E. Specific functions, and accordingly utilities, of VGAM307 correlate with, and may be deduced from, the identity of the host target genes which VGAM307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4262] Nucleotide sequences of the VGAM307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM307 are further described hereinbelow with reference to Table 1.

[4263] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4264] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 308 (VGAM308) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4265] VGAM308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM308 was detected is described hereinabove with reference to Figs. 2–8.

[4266] VGAM308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4267] VGAM308 gene, herein designated VGAM GENE, encodes a VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM308 precursor RNA is designated SEQ ID:294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:294 is located at position 260067 relative to the genome of Paramecium bursaria Chlorella virus 1.

[4268] VGAM308 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4269] An enzyme complex designated DICER COMPLEX, dices the VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM308 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM308 RNA is designated SEQ ID:3019, and is provided hereinbelow with reference to the sequence listing part.

[4270] VGAM308 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4271] VGAM308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM308 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4272] The complementary binding of VGAM308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4273] It is appreciated that VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM308 host target genes. The mRNA of each one of this plurality of VGAM308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM308 RNA, herein designated VGAM

RNA, and which when bound by VGAM308 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM308 host target proteins.

[4274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM308 gene, herein designated VGAM GENE, on one or more VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4275] It is yet further appreciated that a function of VGAM308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM308 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM308 correlate with, and may be deduced from, the identity of the host target genes which VGAM308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4276] Nucleotide sequences of the VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM308 are further described hereinbelow with reference to Table 1.

[4277] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4278] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 309 (VGAM309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4279] VGAM309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM309 was detected is described hereinabove with reference to Figs. 2–8.

[4280] VGAM309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4281] VGAM309 gene, herein designated VGAM GENE, encodes a VGAM309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM309 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM309 precursor RNA is designated SEQ ID:295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:295 is located at position 15267 relative to

the genome of Human herpesvirus 6.

[4282] VGAM309 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4283] An enzyme complex designated DICER COMPLEX, dices the VGAM309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM309 RNA is designated SEQ ID:3020, and is provided hereinbelow with reference to the sequence listing part.

[4284] VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4285] VGAM309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM309 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4286] The complementary binding of VGAM309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4287] It is appreciated that VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM309 host target genes. The mRNA of each one of this plurality of VGAM309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM309 RNA, herein designated VGAM RNA, and which when bound by VGAM309 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM309 host target proteins.

[4288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM309 gene, herein designated VGAM GENE, on one or more VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4289] It is yet further appreciated that a function of VGAM309 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM309 correlate with, and may be deduced from, the identity of the host target genes which VGAM309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4290] Nucleotide sequences of the VGAM309 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM309 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM309 are further described hereinbelow with reference to Table 1.

[4291] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM309 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4292] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 310 (VGAM310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4293] VGAM310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM310 was detected is described hereinabove with reference to Figs. 2–8.

[4294] VGAM310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos latent virus. VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4295] VGAM310 gene, herein designated VGAM GENE, encodes a VGAM310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM310 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM310 precursor RNA is designated SEQ ID:296, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:296 is located at position 512 relative to the genome of Pothos latent virus.

[4296] VGAM310 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4297] An enzyme complex designated DICER COMPLEX, dices the VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM310 RNA is designated SEQ ID:3021, and is provided hereinbelow with reference to the sequence

listing part.

[4298] VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4299] VGAM310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4300] The complementary binding of VGAM310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4301] It is appreciated that VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM310 host target genes. The mRNA of each one of this plurality of VGAM310 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM310 RNA, herein designated VGAM RNA, and which when bound by VGAM310 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM310 host target proteins.

[4302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM310 gene, herein designated VGAM GENE, on one or more VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4303] It is yet further appreciated that a function of VGAM310 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of viral infection by Pothos latent virus. Specific functions, and accordingly utilities, of VGAM310 correlate with, and may be deduced from, the identity of the host target genes which VGAM310 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4304] Nucleotide sequences of the VGAM310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM310 are further described hereinbelow with reference to Table 1.

[4305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4306] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 311 (VGAM311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4307] VGAM311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM311 was detected is described hereinabove with reference to Figs. 2–8.

[4308] VGAM311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos latent virus. VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4309] VGAM311 gene, herein designated VGAM GENE, encodes a VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM311 precursor RNA is designated SEQ ID:297, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:297 is located at position 2180 relative to the genome of Pothos latent virus.

[4310] VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4311] An enzyme complex designated DICER COMPLEX, dices the VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM311 RNA is designated SEQ ID:3022, and

is provided hereinbelow with reference to the sequence listing part.

[4312] VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4313] VGAM311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4314] The complementary binding of VGAM311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4315] It is appreciated that VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM311 host target genes. The mRNA of each one of this plurality of VGAM311 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM311 RNA, herein designated VGAM RNA, and which when bound by VGAM311 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM311 host target proteins.

[4316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM311 gene, herein designated VGAM GENE, on one or more VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4317] It is yet further appreciated that a function of VGAM311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of viral infection by Pothos latent virus. Specific functions, and accordingly utilities, of VGAM311 correlate with, and may be deduced from, the identity of the host target genes which VGAM311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4318] Nucleotide sequences of the VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM311 are further described hereinbelow with reference to Table 1.

[4319] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4320] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 312 (VGAM312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4321] VGAM312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM312 was detected is described hereinabove with reference to Figs. 2–8.

[4322] VGAM312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos latent virus. VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4323] VGAM312 gene, herein designated VGAM GENE, encodes a VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM312 precursor RNA is

designated SEQ ID:298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:298 is located at position 791 relative to the genome of Pothos latent virus.

[4324] VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4325] An enzyme complex designated DICER COMPLEX, dices the VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM312 RNA is designated SEQ ID:3023, and is provided hereinbelow with reference to the sequence listing part.

[4326] VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4327] VGAM312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4328] The complementary binding of VGAM312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4329] It is appreciated that VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM312 host target genes. The mRNA of

each one of this plurality of VGAM312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM312 RNA, herein designated VGAM RNA, and which when bound by VGAM312 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM312 host target proteins.

[4330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM312 gene, herein designated VGAM GENE, on one or more VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[4331] It is yet further appreciated that a function of VGAM312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of viral infection by Pothos latent virus. Specific functions, and accordingly utilities, of VGAM312 correlate with, and may be deduced from, the identity of the host target genes which VGAM312 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[4332] Nucleotide sequences of the VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM312 are further described hereinbelow with reference to Table 1.

[4333] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM312 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[4334] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 313 (VGAM313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4335] VGAM313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM313 was detected is described hereinabove with reference to Figs. 2–8.

[4336] VGAM313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine enteric calicivirus. VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4337] VGAM313 gene, herein designated VGAM GENE, encodes a VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM313 precursor RNA is designated SEQ ID:299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:299 is located at position 2578 relative to the genome of porcine enteric calicivirus.

[4338] VGAM313 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4339] An enzyme complex designated DICER COMPLEX, dices the VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 78%) nucleotide sequence of VGAM313 RNA is designated SEQ ID:3024, and is provided hereinbelow with reference to the sequence listing part.

[4340] VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4341] VGAM313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4342] The complementary binding of VGAM313 RNA, herein designated VGAM RNA, to host target binding sites on VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4343] It is appreciated that VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM313 host target genes. The mRNA of each one of this plurality of VGAM313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM313 RNA, herein designated VGAM RNA, and which when bound by VGAM313 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM313 host target proteins.

[4344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM313 gene, herein designated VGAM GENE, on one or more VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [4345] It is yet further appreciated that a function of VGAM313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of viral infection by porcine enteric calicivirus. Specific functions, and accordingly utilities, of VGAM313 correlate with, and may be deduced from, the identity of the host target genes which VGAM313 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [4346] Nucleotide sequences of the VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM313 are further described hereinbelow with reference to Table 1.
- [4347] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4348] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 314 (VGAM314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4349] VGAM314 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM314 was detected is described hereinabove with reference to Figs. 2–8.

[4350] VGAM314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine adenovirus A. VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4351] VGAM314 gene, herein designated VGAM GENE, encodes a VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM314 precursor RNA is designated SEQ ID:300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:300 is located at position 20841 relative to the genome of Murine adenovirus A.

[4352] VGAM314 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4353] An enzyme complex designated DICER COMPLEX, dices the VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM314 RNA is designated SEQ ID:3025, and is provided hereinbelow with reference to the sequence listing part.

[4354] VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4355] VGAM314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4356] The complementary binding of VGAM314 RNA, herein designated VGAM RNA, to host target binding sites on VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4357] It is appreciated that VGAM314 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM314 host target genes. The mRNA of each one of this plurality of VGAM314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM314 RNA, herein designated VGAM RNA, and which when bound by VGAM314 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM314 host target proteins.

[4358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM314 gene, herein designated VGAM GENE, on one or more VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4359] It is yet further appreciated that a function of VGAM314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of viral infection by Murine adenovirus A. Specific functions, and accordingly utilities, of VGAM314 correlate with, and may be deduced from, the identity of the host target genes which VGAM314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4360] Nucleotide sequences of the VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM314 are further described hereinbelow with reference to Table 1.

[4361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4362] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 315 (VGAM315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4363] VGAM315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM315 was detected is described hereinabove with reference to Figs. 2–8.

[4364] VGAM315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 3. VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4365] VGAM315 gene, herein designated VGAM GENE, encodes a VGAM315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM315 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM315 precursor RNA is designated SEQ ID:301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:301 is located at position 1554 relative to the genome of Cryphonectria hypovirus 3.

[4366] VGAM315 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4367] An enzyme complex designated DICER COMPLEX, dices the VGAM315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM315 RNA is designated SEQ ID:3026, and is provided hereinbelow with reference to the sequence listing part.

[4368] VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4369] VGAM315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4370] The complementary binding of VGAM315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4371] It is appreciated that VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM315 host target genes. The mRNA of each one of this plurality of VGAM315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM315 RNA, herein designated VGAM RNA, and which when bound by VGAM315 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM315 host target proteins.

[4372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM315 gene, herein designated VGAM GENE, on one or more VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4373] It is yet further appreciated that a function of VGAM315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 3. Specific functions, and accordingly utilities, of VGAM315 correlate with, and may be deduced from, the identity of the host target genes which VGAM315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4374] Nucleotide sequences of the VGAM315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM315 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM315 are further described hereinbelow with reference to Table 1.

[4375] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4376] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 316 (VGAM316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4377] VGAM316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM316 was detected is described hereinabove with reference to Figs. 2–8.

[4378] VGAM316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 3. VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4379] VGAM316 gene, herein designated VGAM GENE, encodes a VGAM316 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM316 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM316 precursor RNA is designated SEQ ID:302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:302 is located at position 6108 relative to the genome of Cryphonectria hypovirus 3.

[4380] VGAM316 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4381] An enzyme complex designated DICER COMPLEX, dices the VGAM316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM316 RNA is designated SEQ ID:3027, and is provided hereinbelow with reference to the sequence listing part.

[4382] VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4383] VGAM316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4384] The complementary binding of VGAM316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[4385] It is appreciated that VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM316 host target genes. The mRNA of each one of this plurality of VGAM316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM316 RNA, herein designated VGAM RNA, and which when bound by VGAM316 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM316 host target proteins.

[4386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM316 gene, herein designated VGAM GENE, on one or more VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4387] It is yet further appreciated that a function of VGAM316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 3. Specific functions, and accordingly utilities, of VGAM316 correlate with, and may be deduced from, the identity of the host target genes which VGAM316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4388] Nucleotide sequences of the VGAM316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM316 are further described hereinbelow with reference to Table 1.

[4389] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4390] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 317 (VGAM317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4391] VGAM317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM317 was detected is described hereinabove with reference to Figs. 2-8.

[4392] VGAM317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 3. VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4393] VGAM317 gene, herein designated VGAM GENE, encodes a VGAM317 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM317 precursor RNA is designated SEQ ID:303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:303 is located at position 1398 relative to the genome of Cryphonectria hypovirus 3.

[4394] VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4395] An enzyme complex designated DICER COMPLEX, dices the VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM317 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM317 RNA is designated SEQ ID:3028, and is provided hereinbelow with reference to the sequence listing part.

[4396] VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4397] VGAM317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM317 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM317 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4398] The complementary binding of VGAM317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM317 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4399] It is appreciated that VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM317 host target genes. The mRNA of each one of this plurality of VGAM317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM317 RNA, herein designated VGAM RNA, and which when bound by VGAM317 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM317 host target proteins.

[4400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM317 gene, herein designated VGAM GENE, on one or more VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4401] It is yet further appreciated that a function of VGAM317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 3. Specific functions, and accordingly utilities, of VGAM317 correlate with, and may be deduced from, the identity of the host target genes which VGAM317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4402] Nucleotide sequences of the VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM317 are further described hereinbelow with reference to Table 1.

[4403] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4404] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 318 (VGAM318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4405] VGAM318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM318 was detected is described hereinabove with reference to Figs. 2-8.

[4406] VGAM318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 3. VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4407] VGAM318 gene, herein designated VGAM GENE, encodes a

VGAM318 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM318 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM318 precursor RNA is designated SEQ ID:304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:304 is located at position 739 relative to the genome of Cryphonectria hypovirus 3.

[4408] VGAM318 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4409] An enzyme complex designated DICER COMPLEX, dices the VGAM318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM318 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM318 RNA is designated SEQ ID:3029, and is provided hereinbelow with reference to the sequence listing part.

[4410] VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4411] VGAM318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM318 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4412] The complementary binding of VGAM318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4413] It is appreciated that VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM318 host target genes. The mRNA of each one of this plurality of VGAM318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM318 RNA, herein designated VGAM RNA, and which when bound by VGAM318 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM318 host target proteins.

[4414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM318 gene, herein designated VGAM GENE, on one or more VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4415] It is yet further appreciated that a function of VGAM318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 3. Specific functions, and accordingly utilities, of VGAM318 correlate with, and may be deduced from, the identity of the host target genes which VGAM318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4416] Nucleotide sequences of the VGAM318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM318 are further de-

scribed hereinbelow with reference to Table 1.

[4417] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4418] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 319 (VGAM319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4419] VGAM319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM319 was detected is described hereinabove with reference to Figs. 2-8.

[4420] VGAM319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4421] VGAM319 gene, herein designated VGAM GENE, encodes a VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM319 precursor RNA is designated SEQ ID:305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:305 is located at position 46864 relative to the genome of Myxoma virus.

[4422] VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4423] An enzyme complex designated DICER COMPLEX, dices the VGAM319 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM319 RNA is designated SEQ ID:3030, and is provided hereinbelow with reference to the sequence listing part.

[4424] VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4425] VGAM319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4426] The complementary binding of VGAM319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM319 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4427] It is appreciated that VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM319 host target genes. The mRNA of each one of this plurality of VGAM319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM319 RNA, herein designated VGAM RNA, and which when bound by VGAM319 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM319 host target proteins.

[4428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM319 gene, herein designated VGAM GENE, on one or more VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4429] It is yet further appreciated that a function of VGAM319 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM319 correlate with, and may be deduced from, the identity of the host target genes which VGAM319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4430] Nucleotide sequences of the VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM319 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM319 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM319 are further described hereinbelow with reference to Table 1.

[4431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4432] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 320 (VGAM320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4433] VGAM320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM320 was detected is described hereinabove with reference to Figs. 2-8.

[4434] VGAM320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus.

VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[4435] VGAM320 gene, herein designated VGAM GENE, encodes a VGAM320 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM320 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM320 precursor RNA is designated SEQ ID:306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:306 is located at position 46583 relative to the genome of Myxoma virus.

[4436] VGAM320 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4437] An enzyme complex designated DICER COMPLEX, dices

the VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM320 RNA is designated SEQ ID:3031, and is provided hereinbelow with reference to the sequence listing part.

[4438] VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4439] VGAM320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM320 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4440] The complementary binding of VGAM320 RNA, herein designated VGAM RNA, to host target binding sites on VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4441] It is appreciated that VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM320 host target genes. The mRNA of each one of this plurality of VGAM320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM320 RNA, herein designated VGAM RNA, and which when bound by VGAM320 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM320 host target proteins.

[4442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM320 gene, herein designated VGAM GENE, on one or more VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4443] It is yet further appreciated that a function of VGAM320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM320 correlate with, and may be deduced from, the identity of the host target genes which VGAM320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4444] Nucleotide sequences of the VGAM320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM320 are further described hereinbelow with reference to Table 1.

[4445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4446] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 321 (VGAM321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4447] VGAM321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM321 was detected is described hereinabove with reference to Figs. 2-8.

[4448] VGAM321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus.

VGAM321 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[4449] VGAM321 gene, herein designated VGAM GENE, encodes a VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM321 precursor RNA is designated SEQ ID:307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:307 is located at position 52219 relative to the genome of Myxoma virus.

[4450] VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4451] An enzyme complex designated DICER COMPLEX, dices the VGAM321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM321 RNA is designated SEQ ID:3032, and is provided hereinbelow with reference to the sequence listing part.

[4452] VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4453] VGAM321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4454] The complementary binding of VGAM321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM321 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4455] It is appreciated that VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM321 host target genes. The mRNA of each one of this plurality of VGAM321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM321 RNA, herein designated VGAM RNA, and which when bound by VGAM321 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM321 host target proteins.

[4456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM321 gene, herein designated VGAM GENE, on one or more VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4457] It is yet further appreciated that a function of VGAM321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM321 correlate with, and may be deduced from, the identity of the host target genes which VGAM321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4458] Nucleotide sequences of the VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM321 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM321 are further described hereinbelow with reference to Table 1.

[4459] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM321 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4460] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 322 (VGAM322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4461] VGAM322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM322 was detected is described hereinabove with reference to Figs. 2-8.

[4462] VGAM322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus.

VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4463] VGAM322 gene, herein designated VGAM GENE, encodes a VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM322 precursor RNA is designated SEQ ID:308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:308 is located at position 88846 relative to the genome of Myxoma virus.

[4464] VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[4465] An enzyme complex designated DICER COMPLEX, dices the VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM322 RNA is designated SEQ ID:3033, and is provided hereinbelow with reference to the sequence listing part.

[4466] VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4467] VGAM322 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4468] The complementary binding of VGAM322 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4469] It is appreciated that VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM322 host target genes. The mRNA of each one of this plurality of VGAM322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM322 RNA, herein designated VGAM RNA, and which when bound by VGAM322 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM322 host target proteins.

[4470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM322 gene, herein designated VGAM GENE, on one or more VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4471] It is yet further appreciated that a function of VGAM322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM322 correlate with, and may be deduced from, the identity of the host target genes which VGAM322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4472] Nucleotide sequences of the VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM322 are further described hereinbelow with reference to Table 1.

[4473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4474] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 323 (VGAM323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4475] VGAM323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM323 was detected is described hereinabove with reference to Figs. 2-8.

[4476] VGAM323 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Myxoma virus.

VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4477] VGAM323 gene, herein designated VGAM GENE, encodes a VGAM323 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM323 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM323 precursor RNA is designated SEQ ID:309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:309 is located at position 145414 relative to the genome of Myxoma virus.

[4478] VGAM323 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4479] An enzyme complex designated DICER COMPLEX, dices the VGAM323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM323 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM323 RNA is designated SEQ ID:3034, and is provided hereinbelow with reference to the sequence listing part.

[4480] VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4481] VGAM323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4482] The complementary binding of VGAM323 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4483] It is appreciated that VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM323 host target genes. The mRNA of each one of this plurality of VGAM323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM323 RNA, herein designated VGAM RNA, and which when bound by VGAM323 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM323 host target proteins.

[4484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM323 gene, herein designated VGAM GENE, on one or more VGAM323 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4485] It is yet further appreciated that a function of VGAM323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM323 correlate with, and may be deduced from, the identity of the host target genes which VGAM323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4486] Nucleotide sequences of the VGAM323 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM323 are further described hereinbelow with reference to Table 1.

[4487] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4488] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 324 (VGAM324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4489] VGAM324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM324 was detected is described hereinabove with reference to Figs. 2-8.

[4490] VGAM324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4491] VGAM324 gene, herein designated VGAM GENE, encodes a VGAM324 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM324 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM324 precursor RNA is designated SEQ ID:310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:310 is located at position 65828 relative to the genome of Rabbit fibroma virus.

[4492] VGAM324 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4493] An enzyme complex designated DICER COMPLEX, dices the VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM324 RNA is designated SEQ ID:3035, and is provided hereinbelow with reference to the sequence listing part.

[4494] VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[4495] VGAM324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4496] The complementary binding of VGAM324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4497] It is appreciated that VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM324 host target genes. The mRNA of each one of this plurality of VGAM324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM324 RNA, herein designated VGAM RNA, and which when bound by VGAM324 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM324 host target proteins.

[4498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM324 gene, herein designated VGAM GENE, on one or

more VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4499] It is yet further appreciated that a function of VGAM324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM324 correlate with, and may be deduced from, the identity of the host target genes which VGAM324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4500] Nucleotide sequences of the VGAM324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM324 are further described hereinbelow with reference to Table 1.

[4501] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4502] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 325 (VGAM325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4503] VGAM325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM325 was detected is described

hereinabove with reference to Figs. 2–8.

[4504] VGAM325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4505] VGAM325 gene, herein designated VGAM GENE, encodes a VGAM325 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM325 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM325 precursor RNA is designated SEQ ID:311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:311 is located at position 66316 relative to the genome of Rabbit fibroma virus.

[4506] VGAM325 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4507] An enzyme complex designated DICER COMPLEX, dices the VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM325 RNA is designated SEQ ID:3036, and is provided hereinbelow with reference to the sequence listing part.

[4508] VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4509] VGAM325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[4510] The complementary binding of VGAM325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4511] It is appreciated that VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM325 host target genes. The mRNA of each one of this plurality of VGAM325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM325 RNA, herein designated VGAM RNA, and which when bound by VGAM325 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM325 host target proteins.

[4512] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM325 gene, herein designated VGAM GENE, on one or more VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4513] It is yet further appreciated that a function of VGAM325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM325 correlate with, and may be deduced from, the identity of the host target genes which VGAM325 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[4514] Nucleotide sequences of the VGAM325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM325 are further described hereinbelow with reference to Table 1.

[4515] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4516] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 326 (VGAM326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4517] VGAM326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM326 was detected is described hereinabove with reference to Figs. 2–8.

[4518] VGAM326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus.

VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4519] VGAM326 gene, herein designated VGAM GENE, encodes a VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM326 precursor RNA is designated SEQ ID:312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:312 is located at position 66122 relative to the genome of Rabbit fibroma virus.

[4520] VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4521] An enzyme complex designated DICER COMPLEX, dices the VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM326 RNA is designated SEQ ID:3037, and is provided hereinbelow with reference to the sequence listing part.

[4522] VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4523] VGAM326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4524] The complementary binding of VGAM326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4525] It is appreciated that VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM326 host target genes. The mRNA of each one of this plurality of VGAM326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM326 RNA, herein designated VGAM RNA, and which when bound by VGAM326 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM326 host target proteins.

[4526] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM326 gene, herein designated VGAM GENE, on one or more VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4527] It is yet further appreciated that a function of VGAM326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM326 correlate with, and may be deduced from, the identity of the host target genes which VGAM326 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[4528] Nucleotide sequences of the VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM326 are further described hereinbelow with reference to Table 1.

[4529] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4530] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 327 (VGAM327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4531] VGAM327 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM327 was detected is described hereinabove with reference to Figs. 2–8.

[4532] VGAM327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4533] VGAM327 gene, herein designated VGAM GENE, encodes a VGAM327 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM327 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM327 precursor RNA is designated SEQ ID:313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:313 is located at position 66535 relative to the genome of Rabbit fibroma virus.

[4534] VGAM327 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4535] An enzyme complex designated DICER COMPLEX, dices the VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM327 RNA is designated SEQ ID:3038, and is provided hereinbelow with reference to the sequence listing part.

[4536] VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4537] VGAM327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM327 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4538] The complementary binding of VGAM327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4539] It is appreciated that VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM327 host target genes. The mRNA of each one of this plurality of VGAM327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM327 RNA, herein designated VGAM RNA, and which when bound by VGAM327 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM327 host target proteins.

[4540] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM327 gene, herein designated VGAM GENE, on one or more VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4541] It is yet further appreciated that a function of VGAM327 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM327 correlate with, and may be deduced from, the identity of the

host target genes which VGAM327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4542] Nucleotide sequences of the VGAM327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM327 are further described hereinbelow with reference to Table 1.

[4543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4544] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 328 (VGAM328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4545] VGAM328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM328 was detected is described hereinabove with reference to Figs. 2–8.

[4546] VGAM328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4547] VGAM328 gene, herein designated VGAM GENE, encodes a VGAM328 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM328 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM328 precursor RNA is designated SEQ ID:314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:314 is located at position 68066 relative to the genome of Rabbit fibroma virus.

[4548] VGAM328 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4549] An enzyme complex designated DICER COMPLEX, dices the VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM328 RNA is designated SEQ ID:3039, and is provided hereinbelow with reference to the sequence listing part.

[4550] VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM328 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4551] VGAM328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM328 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4552] The complementary binding of VGAM328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4553] It is appreciated that VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM328 host target genes. The mRNA of each one of this plurality of VGAM328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM328 RNA, herein designated VGAM RNA, and which when bound by VGAM328 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM328 host target proteins.

[4554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM328 gene, herein designated VGAM GENE, on one or more VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4555] It is yet further appreciated that a function of VGAM328 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM328 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4556] Nucleotide sequences of the VGAM328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM328 are further described hereinbelow with reference to Table 1.

[4557] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4558] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 329 (VGAM329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[4559] VGAM329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM329 was detected is described hereinabove with reference to Figs. 2–8.

[4560] VGAM329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4561] VGAM329 gene, herein designated VGAM GENE, encodes a VGAM329 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM329 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM329 precursor RNA is designated SEQ ID:315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:315 is located at position 76498 relative to the genome of Rabbit fibroma virus.

[4562] VGAM329 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM329 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4563] An enzyme complex designated DICER COMPLEX, dices the VGAM329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM329 RNA is designated SEQ ID:3040, and is provided hereinbelow with reference to the sequence listing part.

[4564] VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM329 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4565] VGAM329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4566] The complementary binding of VGAM329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4567] It is appreciated that VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM329 host target genes. The mRNA of each one of this plurality of VGAM329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM329 RNA, herein designated VGAM RNA, and which when bound by VGAM329 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM329 host target proteins.

[4568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM329 gene, herein designated VGAM GENE, on one or more VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4569] It is yet further appreciated that a function of VGAM329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Spe-

cific functions, and accordingly utilities, of VGAM329 correlate with, and may be deduced from, the identity of the host target genes which VGAM329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4570] Nucleotide sequences of the VGAM329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM329 are further described hereinbelow with reference to Table 1.

[4571] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4572] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 330 (VGAM330) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[4573] VGAM330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM330 was detected is described hereinabove with reference to Figs. 2–8.

[4574] VGAM330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4575] VGAM330 gene, herein designated VGAM GENE, encodes a VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM330 precursor RNA is designated SEQ ID:316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:316 is located at position 43800 relative to the genome of Human herpesvirus 5.

[4576] VGAM330 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4577] An enzyme complex designated DICER COMPLEX, dices the VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM330 RNA is designated SEQ ID:3041, and is provided hereinbelow with reference to the sequence listing part.

[4578] VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4579] VGAM330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM330 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4580] The complementary binding of VGAM330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4581] It is appreciated that VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM330 host target genes. The mRNA of each one of this plurality of VGAM330 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM330 RNA, herein designated VGAM RNA, and which when bound by VGAM330 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM330 host target proteins.

[4582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM330 gene, herein designated VGAM GENE, on one or more VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4583] It is yet further appreciated that a function of VGAM330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM330 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM330 correlate with, and may be deduced from, the identity of the host target genes which VGAM330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4584] Nucleotide sequences of the VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM330 are further described hereinbelow with reference to Table 1.

[4585] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM330 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4586] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 331 (VGAM331) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4587] VGAM331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM331 was detected is described hereinabove with reference to Figs. 2–8.

[4588] VGAM331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4589] VGAM331 gene, herein designated VGAM GENE, encodes a VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM331 precursor RNA is designated SEQ ID:317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:317 is located at position 113291 relative to the genome of Human herpesvirus 5.

[4590] VGAM331 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4591] An enzyme complex designated DICER COMPLEX, dices the VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM331 RNA is designated SEQ ID:3042, and is provided hereinbelow with reference to the sequence listing part.

[4592] VGAM331 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4593] VGAM331 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM331 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4594] The complementary binding of VGAM331 RNA, herein designated VGAM RNA, to host target binding sites on VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM331 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4595] It is appreciated that VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM331 host target genes. The mRNA of each one of this plurality of VGAM331 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM331 RNA, herein designated VGAM

RNA, and which when bound by VGAM331 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM331 host target proteins.

[4596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM331 gene, herein designated VGAM GENE, on one or more VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4597] It is yet further appreciated that a function of VGAM331 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM331 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM331 correlate with, and may be deduced from, the identity of the host target genes which VGAM331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4598] Nucleotide sequences of the VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM331 are further described hereinbelow with reference to Table 1.

[4599] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM331 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4600] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 332 (VGAM332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4601] VGAM332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM332 was detected is described hereinabove with reference to Figs. 2–8.

[4602] VGAM332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4603] VGAM332 gene, herein designated VGAM GENE, encodes a VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM332 precursor RNA is designated SEQ ID:318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:318 is located at position 86054 relative to

the genome of Human herpesvirus 3.

[4604] VGAM332 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4605] An enzyme complex designated DICER COMPLEX, dices the VGAM332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM332 RNA is designated SEQ ID:3043, and is provided hereinbelow with reference to the sequence listing part.

[4606] VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4607] VGAM332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM332 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM332 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4608] The complementary binding of VGAM332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4609] It is appreciated that VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM332 host target genes. The mRNA of each one of this plurality of VGAM332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM332 RNA, herein designated VGAM RNA, and which when bound by VGAM332 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM332 host target proteins.

[4610] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM332 gene, herein designated VGAM GENE, on one or more VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4611] It is yet further appreciated that a function of VGAM332 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM332 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM332 correlate with, and may be deduced from, the identity of the host target genes which VGAM332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4612] Nucleotide sequences of the VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM332 are further described hereinbelow with reference to Table 1.

[4613] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4614] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 333 (VGAM333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4615] VGAM333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM333 was detected is described hereinabove with reference to Figs. 2–8.

[4616] VGAM333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4617] VGAM333 gene, herein designated VGAM GENE, encodes a VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM333 precursor RNA is designated SEQ ID:319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:319 is located at position 97703 relative to the genome of Human herpesvirus 3.

[4618] VGAM333 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4619] An enzyme complex designated DICER COMPLEX, dices the VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM333 RNA is designated SEQ ID:3044, and is provided hereinbelow with reference to the sequence

listing part.

[4620] VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4621] VGAM333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4622] The complementary binding of VGAM333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4623] It is appreciated that VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM333 host target genes. The mRNA of each one of this plurality of VGAM333 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM333 RNA, herein designated VGAM RNA, and which when bound by VGAM333 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM333 host target proteins.

[4624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM333 gene, herein designated VGAM GENE, on one or more VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4625] It is yet further appreciated that a function of VGAM333 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM333 correlate with, and may be deduced from, the identity of the host target genes which VGAM333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4626] Nucleotide sequences of the VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM333 are further described hereinbelow with reference to Table 1.

[4627] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4628] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 334 (VGAM334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4629] VGAM334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM334 was detected is described hereinabove with reference to Figs. 2–8.

[4630] VGAM334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4631] VGAM334 gene, herein designated VGAM GENE, encodes a VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM334 precursor RNA is designated SEQ ID:320, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:320 is located at position 97885 relative to the genome of Human herpesvirus 3.

[4632] VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4633] An enzyme complex designated DICER COMPLEX, dices the VGAM334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM334 RNA is designated SEQ ID:3045, and

is provided hereinbelow with reference to the sequence listing part.

[4634] VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4635] VGAM334 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4636] The complementary binding of VGAM334 RNA, herein designated VGAM RNA, to host target binding sites on VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4637] It is appreciated that VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM334 host target genes. The mRNA of each one of this plurality of VGAM334 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM334 RNA, herein designated VGAM RNA, and which when bound by VGAM334 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM334 host target proteins.

[4638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM334 gene, herein designated VGAM GENE, on one or more VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4639] It is yet further appreciated that a function of VGAM334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM334 correlate with, and may be deduced from, the identity of the host target genes which VGAM334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4640] Nucleotide sequences of the VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM334 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM334 are further described hereinbelow with reference to Table 1.

[4641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4642] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 335 (VGAM335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4643] VGAM335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM335 was detected is described hereinabove with reference to Figs. 2–8.

[4644] VGAM335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4645] VGAM335 gene, herein designated VGAM GENE, encodes a VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM335 precursor RNA is

designated SEQ ID:321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:321 is located at position 23128 relative to the genome of Saimiriine herpesvirus 2.

[4646] VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4647] An enzyme complex designated DICER COMPLEX, dices the VGAM335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide se-

quence of VGAM335 RNA is designated SEQ ID:3046, and is provided hereinbelow with reference to the sequence listing part.

[4648] VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4649] VGAM335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4650] The complementary binding of VGAM335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4651] It is appreciated that VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM335 host target genes. The mRNA of

each one of this plurality of VGAM335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM335 RNA, herein designated VGAM RNA, and which when bound by VGAM335 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM335 host target proteins.

[4652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM335 gene, herein designated VGAM GENE, on one or more VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[4653] It is yet further appreciated that a function of VGAM335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM335 correlate with, and may be deduced from, the identity of the host target genes which VGAM335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4654] Nucleotide sequences of the VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM335 are further described hereinbelow with reference to Table 1.

[4655] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM335 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[4656] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 336 (VGAM336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4657] VGAM336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM336 was detected is described hereinabove with reference to Figs. 2–8.

[4658] VGAM336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4659] VGAM336 gene, herein designated VGAM GENE, encodes a VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM336 precursor RNA is designated SEQ ID:322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:322 is located at position 23007 relative to the genome of Saimiriine herpesvirus 2.

[4660] VGAM336 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4661] An enzyme complex designated DICER COMPLEX, dices the VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 55%) nucleotide sequence of VGAM336 RNA is designated SEQ ID:3047, and is provided hereinbelow with reference to the sequence listing part.

[4662] VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4663] VGAM336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4664] The complementary binding of VGAM336 RNA, herein designated VGAM RNA, to host target binding sites on VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM336 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4665] It is appreciated that VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM336 host target genes. The mRNA of each one of this plurality of VGAM336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM336 RNA, herein designated VGAM RNA, and which when bound by VGAM336 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM336 host target proteins.

[4666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM336 gene, herein designated VGAM GENE, on one or more VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[4667] It is yet further appreciated that a function of VGAM336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM336 correlate with, and may be deduced from, the identity of the host target genes which VGAM336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4668] Nucleotide sequences of the VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM336 are further described hereinbelow with reference to Table 1.

[4669] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4670] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 337 (VGAM337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4671] VGAM337 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM337 was detected is described hereinabove with reference to Figs. 2–8.

[4672] VGAM337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4673] VGAM337 gene, herein designated VGAM GENE, encodes a VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM337 precursor RNA is designated SEQ ID:323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:323 is located at position 22516 relative to the genome of Saimiriine herpesvirus 2.

[4674] VGAM337 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4675] An enzyme complex designated DICER COMPLEX, dices the VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM337 RNA is designated SEQ ID:3048, and is provided hereinbelow with reference to the sequence listing part.

[4676] VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4677] VGAM337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4678] The complementary binding of VGAM337 RNA, herein designated VGAM RNA, to host target binding sites on VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4679] It is appreciated that VGAM337 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM337 host target genes. The mRNA of each one of this plurality of VGAM337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM337 RNA, herein designated VGAM RNA, and which when bound by VGAM337 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM337 host target proteins.

[4680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM337 gene, herein designated VGAM GENE, on one or more VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4681] It is yet further appreciated that a function of VGAM337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM337 correlate with, and may be deduced from, the identity of the host target genes which VGAM337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4682] Nucleotide sequences of the VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM337 are further described hereinbelow with reference to Table 1.

[4683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4684] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 338 (VGAM338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4685] VGAM338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM338 was detected is described hereinabove with reference to Figs. 2–8.

[4686] VGAM338 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4687] VGAM338 gene, herein designated VGAM GENE, encodes a VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM338 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM338 precursor RNA is designated SEQ ID:324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:324 is located at position 21425 relative to the genome of Saimiriine herpesvirus 2.

[4688] VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4689] An enzyme complex designated DICER COMPLEX, dices the VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM338 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM338 RNA is designated SEQ ID:3049, and is provided hereinbelow with reference to the sequence listing part.

[4690] VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4691] VGAM338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4692] The complementary binding of VGAM338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4693] It is appreciated that VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM338 host target genes. The mRNA of each one of this plurality of VGAM338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM338 RNA, herein designated VGAM RNA, and which when bound by VGAM338 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM338 host target proteins.

[4694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM338 gene, herein designated VGAM GENE, on one or more VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4695] It is yet further appreciated that a function of VGAM338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM338 correlate with, and may be deduced from, the identity of the host target genes which VGAM338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4696] Nucleotide sequences of the VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM338 are further described hereinbelow with reference to Table 1.

[4697] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4698] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 339 (VGAM339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4699] VGAM339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM339 was detected is described hereinabove with reference to Figs. 2–8.

[4700] VGAM339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4701] VGAM339 gene, herein designated VGAM GENE, encodes a VGAM339 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM339 precursor RNA is designated SEQ ID:325, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:325 is located at position 22382 relative to the genome of Saimiriine herpesvirus 2.

[4702] VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4703] An enzyme complex designated DICER COMPLEX, dices the VGAM339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM339 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM339 RNA is designated SEQ ID:3050, and is provided hereinbelow with reference to the sequence listing part.

[4704] VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4705] VGAM339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4706] The complementary binding of VGAM339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[4707] It is appreciated that VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM339 host target genes. The mRNA of each one of this plurality of VGAM339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM339 RNA, herein designated VGAM RNA, and which when bound by VGAM339 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM339 host target proteins.

[4708] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM339 gene, herein designated VGAM GENE, on one or more VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4709] It is yet further appreciated that a function of VGAM339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM339 correlate with, and may be deduced from, the identity of the host target genes which VGAM339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4710] Nucleotide sequences of the VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM339 are further described hereinbelow with reference to Table 1.

[4711] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4712] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 340 (VGAM340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4713] VGAM340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM340 was detected is described hereinabove with reference to Figs. 2-8.

[4714] VGAM340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco mosaic virus. VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4715] VGAM340 gene, herein designated VGAM GENE, encodes a VGAM340 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM340 precursor RNA is designated SEQ ID:326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:326 is located at position 3101 relative to the genome of Tobacco mosaic virus.

[4716] VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4717] An enzyme complex designated DICER COMPLEX, dices the VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM340 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM340 RNA is designated SEQ ID:3051, and is provided hereinbelow with reference to the sequence listing part.

[4718] VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4719] VGAM340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM340 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4720] The complementary binding of VGAM340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM340 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4721] It is appreciated that VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM340 host target genes. The mRNA of each one of this plurality of VGAM340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM340 RNA, herein designated VGAM RNA, and which when bound by VGAM340 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM340 host target proteins.

[4722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM340 gene, herein designated VGAM GENE, on one or more VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4723] It is yet further appreciated that a function of VGAM340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of viral infection by Tobacco mosaic virus. Specific functions, and accordingly utilities, of VGAM340 correlate with, and may be deduced from, the identity of the host target genes which VGAM340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4724] Nucleotide sequences of the VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM340 are further described hereinbelow with reference to Table 1.

[4725] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM340 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4726] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 341 (VGAM341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4727] VGAM341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM341 was detected is described hereinabove with reference to Figs. 2-8.

[4728] VGAM341 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco mosaic virus. VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4729] VGAM341 gene, herein designated VGAM GENE, encodes a

VGAM341 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM341 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM341 precursor RNA is designated SEQ ID:327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:327 is located at position 2648 relative to the genome of Tobacco mosaic virus.

[4730] VGAM341 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4731] An enzyme complex designated DICER COMPLEX, dices the VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM341 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM341 RNA is designated SEQ ID:3052, and is provided hereinbelow with reference to the sequence listing part.

[4732] VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4733] VGAM341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM341 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4734] The complementary binding of VGAM341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4735] It is appreciated that VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM341 host target genes. The mRNA of each one of this plurality of VGAM341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM341 RNA, herein designated VGAM RNA, and which when bound by VGAM341 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM341 host target proteins.

[4736] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM341 gene, herein designated VGAM GENE, on one or more VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4737] It is yet further appreciated that a function of VGAM341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of viral infection by Tobacco mosaic virus. Specific functions, and accordingly utilities, of VGAM341 correlate with, and may be deduced from, the identity of the host target genes which VGAM341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4738] Nucleotide sequences of the VGAM341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM341 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM341 are further de-

scribed hereinbelow with reference to Table 1.

[4739] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4740] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 342 (VGAM342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4741] VGAM342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM342 was detected is described hereinabove with reference to Figs. 2-8.

[4742] VGAM342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco mosaic virus. VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4743] VGAM342 gene, herein designated VGAM GENE, encodes a VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM342 precursor RNA is designated SEQ ID:328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:328 is located at position 3311 relative to the genome of Tobacco mosaic virus.

[4744] VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4745] An enzyme complex designated DICER COMPLEX, dices the VGAM342 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM342 RNA is designated SEQ ID:3053, and is provided hereinbelow with reference to the sequence listing part.

[4746] VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4747] VGAM342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4748] The complementary binding of VGAM342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM342 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM342 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4749] It is appreciated that VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM342 host target genes. The mRNA of each one of this plurality of VGAM342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM342 RNA, herein designated VGAM RNA, and which when bound by VGAM342 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM342 host target proteins.

[4750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM342 gene, herein designated VGAM GENE, on one or more VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4751] It is yet further appreciated that a function of VGAM342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of viral infection by Tobacco mosaic virus. Specific functions, and accordingly utilities, of VGAM342 correlate with, and may be deduced from, the identity of the host target genes which VGAM342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4752] Nucleotide sequences of the VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM342 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM342 are further described hereinbelow with reference to Table 1.

[4753] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4754] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 343 (VGAM343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4755] VGAM343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM343 was detected is described hereinabove with reference to Figs. 2-8.

[4756] VGAM343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco mosaic virus. VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[4757] VGAM343 gene, herein designated VGAM GENE, encodes a VGAM343 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM343 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM343 precursor RNA is designated SEQ ID:329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:329 is located at position 1903 relative to the genome of Tobacco mosaic virus.

[4758] VGAM343 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4759] An enzyme complex designated DICER COMPLEX, dices

the VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM343 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM343 RNA is designated SEQ ID:3054, and is provided hereinbelow with reference to the sequence listing part.

[4760] VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4761] VGAM343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM343 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4762] The complementary binding of VGAM343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4763] It is appreciated that VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM343 host target genes. The mRNA of each one of this plurality of VGAM343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM343 RNA, herein designated VGAM RNA, and which when bound by VGAM343 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM343 host target proteins.

[4764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM343 gene, herein designated VGAM GENE, on one or more VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4765] It is yet further appreciated that a function of VGAM343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of viral infection by Tobacco mosaic virus. Specific functions, and accordingly utilities, of VGAM343 correlate with, and may be deduced from, the identity of the host target genes which VGAM343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4766] Nucleotide sequences of the VGAM343 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM343 are further described hereinbelow with reference to Table 1.

[4767] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4768] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 344 (VGAM344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4769] VGAM344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM344 was detected is described hereinabove with reference to Figs. 2-8.

[4770] VGAM344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco mosaic virus. VGAM344 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[4771] VGAM344 gene, herein designated VGAM GENE, encodes a VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM344 precursor RNA is designated SEQ ID:330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:330 is located at position 2117 relative to the genome of Tobacco mosaic virus.

[4772] VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4773] An enzyme complex designated DICER COMPLEX, dices the VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM344 RNA is designated SEQ ID:3055, and is provided hereinbelow with reference to the sequence listing part.

[4774] VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4775] VGAM344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4776] The complementary binding of VGAM344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM344 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4777] It is appreciated that VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM344 host target genes. The mRNA of each one of this plurality of VGAM344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM344 RNA, herein designated VGAM RNA, and which when bound by VGAM344 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM344 host target proteins.

[4778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM344 gene, herein designated VGAM GENE, on one or more VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4779] It is yet further appreciated that a function of VGAM344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of viral infection by Tobacco mosaic virus. Specific functions, and accordingly utilities, of VGAM344 correlate with, and may be deduced from, the identity of the host target genes which VGAM344 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4780] Nucleotide sequences of the VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM344 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM344 are further described hereinbelow with reference to Table 1.

[4781] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4782] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 345 (VGAM345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4783] VGAM345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM345 was detected is described hereinabove with reference to Figs. 2-8.

[4784] VGAM345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C.

VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4785] VGAM345 gene, herein designated VGAM GENE, encodes a VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM345 precursor RNA is designated SEQ ID:331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:331 is located at position 19970 relative to the genome of Human adenovirus C.

[4786] VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

- [4787] An enzyme complex designated DICER COMPLEX, dices the VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM345 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM345 RNA is designated SEQ ID:3056, and is provided hereinbelow with reference to the sequence listing part.
- [4788] VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [4789] VGAM345 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4790] The complementary binding of VGAM345 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4791] It is appreciated that VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM345 host target genes. The mRNA of each one of this plurality of VGAM345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM345 RNA, herein designated VGAM RNA, and which when bound by VGAM345 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM345 host target proteins.

[4792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM345 gene, herein designated VGAM GENE, on one or more VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4793] It is yet further appreciated that a function of VGAM345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Specific functions, and accordingly utilities, of VGAM345 correlate with, and may be deduced from, the identity of the host target genes which VGAM345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4794] Nucleotide sequences of the VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM345 are further described hereinbelow with reference to Table 1.

[4795] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4796] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 346 (VGAM346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4797] VGAM346 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM346 was detected is described hereinabove with reference to Figs. 2-8.

[4798] VGAM346 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Black beetle virus.

VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4799] VGAM346 gene, herein designated VGAM GENE, encodes a VGAM346 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM346 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM346 precursor RNA is designated SEQ ID:332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:332 is located at position 1124 relative to the genome of Black beetle virus.

[4800] VGAM346 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4801] An enzyme complex designated DICER COMPLEX, dices the VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM346 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM346 RNA is designated SEQ ID:3057, and is provided hereinbelow with reference to the sequence listing part.

[4802] VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4803] VGAM346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4804] The complementary binding of VGAM346 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4805] It is appreciated that VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM346 host target genes. The mRNA of each one of this plurality of VGAM346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM346 RNA, herein designated VGAM RNA, and which when bound by VGAM346 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM346 host target proteins.

[4806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM346 gene, herein designated VGAM GENE, on one or more VGAM346 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4807] It is yet further appreciated that a function of VGAM346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of viral infection by Black beetle virus. Specific functions, and accordingly utilities, of VGAM346 correlate with, and may be deduced from, the identity of the host target genes which VGAM346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4808] Nucleotide sequences of the VGAM346 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM346 are further described hereinbelow with reference to Table 1.

[4809] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4810] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 347 (VGAM347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4811] VGAM347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM347 was detected is described hereinabove with reference to Figs. 2-8.

[4812] VGAM347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Black beetle virus.

VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4813] VGAM347 gene, herein designated VGAM GENE, encodes a VGAM347 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM347 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM347 precursor RNA is designated SEQ ID:333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:333 is located at position 1731 relative to the genome of Black beetle virus.

[4814] VGAM347 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4815] An enzyme complex designated DICER COMPLEX, dices the VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM347 RNA is designated SEQ ID:3058, and is provided hereinbelow with reference to the sequence listing part.

[4816] VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[4817] VGAM347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4818] The complementary binding of VGAM347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4819] It is appreciated that VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM347 host target genes. The mRNA of each one of this plurality of VGAM347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM347 RNA, herein designated VGAM RNA, and which when bound by VGAM347 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM347 host target proteins.

[4820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM347 gene, herein designated VGAM GENE, on one or

more VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4821] It is yet further appreciated that a function of VGAM347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of viral infection by Black beetle virus. Specific functions, and accordingly utilities, of VGAM347 correlate with, and may be deduced from, the identity of the host target genes which VGAM347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4822] Nucleotide sequences of the VGAM347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM347 are further described hereinbelow with reference to Table 1.

[4823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4824] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 348 (VGAM348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4825] VGAM348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM348 was detected is described

hereinabove with reference to Figs. 2–8.

[4826] VGAM348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus C. VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4827] VGAM348 gene, herein designated VGAM GENE, encodes a VGAM348 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM348 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM348 precursor RNA is designated SEQ ID:334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:334 is located at position 5074 relative to the genome of Human enterovirus C.

[4828] VGAM348 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4829] An enzyme complex designated DICER COMPLEX, dices the VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM348 RNA is designated SEQ ID:3059, and is provided hereinbelow with reference to the sequence listing part.

[4830] VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4831] VGAM348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[4832] The complementary binding of VGAM348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4833] It is appreciated that VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM348 host target genes. The mRNA of each one of this plurality of VGAM348 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM348 RNA, herein designated VGAM RNA, and which when bound by VGAM348 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM348 host target proteins.

[4834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM348 gene, herein designated VGAM GENE, on one or more VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4835] It is yet further appreciated that a function of VGAM348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of viral infection by Human enterovirus C. Specific functions, and accordingly utilities, of VGAM348 correlate with, and may be deduced from, the identity of the host target genes which VGAM348 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[4836] Nucleotide sequences of the VGAM348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM348 are further described hereinbelow with reference to Table 1.

[4837] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4838] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 349 (VGAM349) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4839] VGAM349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM349 was detected is described hereinabove with reference to Figs. 2–8.

[4840] VGAM349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus C. VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4841] VGAM349 gene, herein designated VGAM GENE, encodes a VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM349 precursor RNA is designated SEQ ID:335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:335 is located at position 7103 relative to the genome of Human enterovirus C.

[4842] VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4843] An enzyme complex designated DICER COMPLEX, dices the VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM349 RNA is designated SEQ ID:3060, and is provided hereinbelow with reference to the sequence listing part.

[4844] VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4845] VGAM349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4846] The complementary binding of VGAM349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM349 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4847] It is appreciated that VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM349 host target genes. The mRNA of each one of this plurality of VGAM349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM349 RNA, herein designated VGAM RNA, and which when bound by VGAM349 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM349 host target proteins.

[4848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM349 gene, herein designated VGAM GENE, on one or more VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4849] It is yet further appreciated that a function of VGAM349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of viral infection by Human enterovirus C. Specific functions, and accordingly utilities, of VGAM349 correlate with, and may be deduced from, the identity of the host target genes which VGAM349 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[4850] Nucleotide sequences of the VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM349 are further described hereinbelow with reference to Table 1.

[4851] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4852] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 350 (VGAM350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4853] VGAM350 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM350 was detected is described hereinabove with reference to Figs. 2–8.

[4854] VGAM350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4855] VGAM350 gene, herein designated VGAM GENE, encodes a VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM350 precursor RNA is designated SEQ ID:336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:336 is located at position 2089 relative to the genome of Avian infectious bronchitis virus.

[4856] VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4857] An enzyme complex designated DICER COMPLEX, dices the VGAM350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM350 RNA is designated SEQ ID:3061, and is provided hereinbelow with reference to the sequence listing part.

[4858] VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4859] VGAM350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM350 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4860] The complementary binding of VGAM350 RNA, herein designated VGAM RNA, to host target binding sites on VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4861] It is appreciated that VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM350 host target genes. The mRNA of each one of this plurality of VGAM350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM350 RNA, herein designated VGAM RNA, and which when bound by VGAM350 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM350 host target proteins.

[4862] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM350 gene, herein designated VGAM GENE, on one or more VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4863] It is yet further appreciated that a function of VGAM350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM350 correlate with, and may be deduced from, the

identity of the host target genes which VGAM350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4864] Nucleotide sequences of the VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM350 are further described hereinbelow with reference to Table 1.

[4865] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4866] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 351 (VGAM351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4867] VGAM351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM351 was detected is described hereinabove with reference to Figs. 2–8.

[4868] VGAM351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4869] VGAM351 gene, herein designated VGAM GENE, encodes a VGAM351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM351 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM351 precursor RNA is designated SEQ ID:337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:337 is located at position 8232 relative to the genome of Avian infectious bronchitis virus.

[4870] VGAM351 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM351 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4871] An enzyme complex designated DICER COMPLEX, dices the VGAM351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM351 RNA is designated SEQ ID:3062, and is provided hereinbelow with reference to the sequence listing part.

[4872] VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM351 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4873] VGAM351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM351 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4874] The complementary binding of VGAM351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4875] It is appreciated that VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM351 host target genes. The mRNA of each one of this plurality of VGAM351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM351 RNA, herein designated VGAM RNA, and which when bound by VGAM351 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM351 host target proteins.

[4876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM351 gene, herein designated VGAM GENE, on one or more VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4877] It is yet further appreciated that a function of VGAM351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of

VGAM351 correlate with, and may be deduced from, the identity of the host target genes which VGAM351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4878] Nucleotide sequences of the VGAM351 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM351 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM351 are further described hereinbelow with reference to Table 1.

[4879] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM351 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4880] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 352 (VGAM352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[4881] VGAM352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM352 was detected is described hereinabove with reference to Figs. 2–8.

[4882] VGAM352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4883] VGAM352 gene, herein designated VGAM GENE, encodes a VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM352 precursor RNA is designated SEQ ID:338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:338 is located at position 4158 relative to the genome of Avian infectious bronchitis virus.

[4884] VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM352 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4885] An enzyme complex designated DICER COMPLEX, dices the VGAM352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM352 RNA is designated SEQ ID:3063, and is provided hereinbelow with reference to the sequence listing part.

[4886] VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM352 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4887] VGAM352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4888] The complementary binding of VGAM352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4889] It is appreciated that VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM352 host target genes. The mRNA of each one of this plurality of VGAM352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM352 RNA, herein designated VGAM RNA, and which when bound by VGAM352 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM352 host target proteins.

[4890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM352 gene, herein designated VGAM GENE, on one or more VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4891] It is yet further appreciated that a function of VGAM352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis

virus. Specific functions, and accordingly utilities, of VGAM352 correlate with, and may be deduced from, the identity of the host target genes which VGAM352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4892] Nucleotide sequences of the VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM352 are further described hereinbelow with reference to Table 1.

[4893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM352 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4894] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 353 (VGAM353) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[4895] VGAM353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM353 was detected is described hereinabove with reference to Figs. 2–8.

[4896] VGAM353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4897] VGAM353 gene, herein designated VGAM GENE, encodes a VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM353 precursor RNA is designated SEQ ID:339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:339 is located at position 6850 relative to the genome of Avian infectious bronchitis virus.

[4898] VGAM353 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4899] An enzyme complex designated DICER COMPLEX, dices the VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM353 RNA is designated SEQ ID:3064, and is provided hereinbelow with reference to the sequence listing part.

[4900] VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4901] VGAM353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM353 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4902] The complementary binding of VGAM353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4903] It is appreciated that VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM353 host target genes. The mRNA of each one of this plurality of VGAM353 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM353 RNA, herein designated VGAM RNA, and which when bound by VGAM353 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM353 host target proteins.

[4904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM353 gene, herein designated VGAM GENE, on one or more VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4905] It is yet further appreciated that a function of VGAM353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM353 include diagnosis, prevention and

treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM353 correlate with, and may be deduced from, the identity of the host target genes which VGAM353 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4906] Nucleotide sequences of the VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM353 are further described hereinbelow with reference to Table 1.

[4907] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4908] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 354 (VGAM354) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4909] VGAM354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM354 was detected is described hereinabove with reference to Figs. 2–8.

[4910] VGAM354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4911] VGAM354 gene, herein designated VGAM GENE, encodes a VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM354 precursor RNA is designated SEQ ID:340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:340 is located at position 7380 relative to the genome of Avian infectious bronchitis virus.

[4912] VGAM354 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4913] An enzyme complex designated DICER COMPLEX, dices the VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM354 RNA is designated SEQ ID:3065, and is provided hereinbelow with reference to the sequence listing part.

[4914] VGAM354 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4915] VGAM354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM354 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4916] The complementary binding of VGAM354 RNA, herein designated VGAM RNA, to host target binding sites on VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4917] It is appreciated that VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM354 host target genes. The mRNA of each one of this plurality of VGAM354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM354 RNA, herein designated VGAM

RNA, and which when bound by VGAM354 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM354 host target proteins.

[4918] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM354 gene, herein designated VGAM GENE, on one or more VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4919] It is yet further appreciated that a function of VGAM354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM354 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM354 correlate with, and may be deduced from, the identity of the host target genes which VGAM354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4920] Nucleotide sequences of the VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM354 are further described hereinbelow with reference to Table 1.

[4921] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM354 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4922] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 355 (VGAM355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4923] VGAM355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM355 was detected is described hereinabove with reference to Figs. 2–8.

[4924] VGAM355 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4925] VGAM355 gene, herein designated VGAM GENE, encodes a VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM355 precursor RNA is designated SEQ ID:341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:341 is located at position 931 relative to

the genome of Avian infectious bronchitis virus.

[4926] VGAM355 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4927] An enzyme complex designated DICER COMPLEX, dices the VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM355 RNA is designated SEQ ID:3066, and is provided hereinbelow with reference to the sequence listing part.

[4928] VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4929] VGAM355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM355 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4930] The complementary binding of VGAM355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4931] It is appreciated that VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM355 host target genes. The mRNA of each one of this plurality of VGAM355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM355 RNA, herein designated VGAM RNA, and which when bound by VGAM355 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM355 host target proteins.

[4932] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM355 gene, herein designated VGAM GENE, on one or more VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4933] It is yet further appreciated that a function of VGAM355 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM355 correlate with, and may be deduced from, the identity of the host target genes which VGAM355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4934] Nucleotide sequences of the VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM355 are further described hereinbelow with reference to Table 1.

[4935] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4936] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 356 (VGAM356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4937] VGAM356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM356 was detected is described hereinabove with reference to Figs. 2–8.

[4938] VGAM356 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4939] VGAM356 gene, herein designated VGAM GENE, encodes a VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM356 precursor RNA is designated SEQ ID:342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:342 is located at position 6336 relative to the genome of Avian infectious bronchitis virus.

[4940] VGAM356 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4941] An enzyme complex designated DICER COMPLEX, dices the VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM356 RNA is designated SEQ ID:3067, and is provided hereinbelow with reference to the sequence

listing part.

[4942] VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4943] VGAM356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4944] The complementary binding of VGAM356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4945] It is appreciated that VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM356 host target genes. The mRNA of each one of this plurality of VGAM356 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM356 RNA, herein designated VGAM RNA, and which when bound by VGAM356 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM356 host target proteins.

[4946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM356 gene, herein designated VGAM GENE, on one or more VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4947] It is yet further appreciated that a function of VGAM356 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM356 correlate with, and may be deduced from, the identity of the host target genes which VGAM356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4948] Nucleotide sequences of the VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM356 are further described hereinbelow with reference to Table 1.

[4949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4950] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 357 (VGAM357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4951] VGAM357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM357 was detected is described hereinabove with reference to Figs. 2–8.

[4952] VGAM357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4953] VGAM357 gene, herein designated VGAM GENE, encodes a VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM357 precursor RNA is designated SEQ ID:343, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:343 is located at position 1864 relative to the genome of Avian infectious bronchitis virus.

[4954] VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4955] An enzyme complex designated DICER COMPLEX, dices the VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM357 RNA is designated SEQ ID:3068, and

is provided hereinbelow with reference to the sequence listing part.

[4956] VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4957] VGAM357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4958] The complementary binding of VGAM357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM357 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4959] It is appreciated that VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM357 host target genes. The mRNA of each one of this plurality of VGAM357 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM357 RNA, herein designated VGAM RNA, and which when bound by VGAM357 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM357 host target proteins.

[4960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM357 gene, herein designated VGAM GENE, on one or more VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4961] It is yet further appreciated that a function of VGAM357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM357 correlate with, and may be deduced from, the identity of the host target genes which VGAM357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4962] Nucleotide sequences of the VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM357 are further described hereinbelow with reference to Table 1.

[4963] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4964] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 358 (VGAM358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4965] VGAM358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM358 was detected is described hereinabove with reference to Figs. 2–8.

[4966] VGAM358 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4967] VGAM358 gene, herein designated VGAM GENE, encodes a VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM358 precursor RNA is

designated SEQ ID:344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:344 is located at position 10172 relative to the genome of Avian infectious bronchitis virus.

[4968] VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4969] An enzyme complex designated DICER COMPLEX, dices the VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM358 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide se-

quence of VGAM358 RNA is designated SEQ ID:3069, and is provided hereinbelow with reference to the sequence listing part.

[4970] VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4971] VGAM358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4972] The complementary binding of VGAM358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4973] It is appreciated that VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM358 host target genes. The mRNA of

each one of this plurality of VGAM358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM358 RNA, herein designated VGAM RNA, and which when bound by VGAM358 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM358 host target proteins.

[4974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM358 gene, herein designated VGAM GENE, on one or more VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[4975] It is yet further appreciated that a function of VGAM358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM358 correlate with, and may be deduced from, the identity of the host target genes which VGAM358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4976] Nucleotide sequences of the VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM358 are further described hereinbelow with reference to Table 1.

[4977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM358 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[4978] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 359 (VGAM359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4979] VGAM359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM359 was detected is described hereinabove with reference to Figs. 2–8.

[4980] VGAM359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4981] VGAM359 gene, herein designated VGAM GENE, encodes a VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM359 precursor RNA is designated SEQ ID:345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:345 is located at position 9184 relative to the genome of Avian infectious bronchitis virus.

[4982] VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4983] An enzyme complex designated DICER COMPLEX, dices the VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM359 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 81%) nucleotide sequence of VGAM359 RNA is designated SEQ ID:3070, and is provided hereinbelow with reference to the sequence listing part.

[4984] VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4985] VGAM359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4986] The complementary binding of VGAM359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM359 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[4987] It is appreciated that VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM359 host target genes. The mRNA of each one of this plurality of VGAM359 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM359 RNA, herein designated VGAM RNA, and which when bound by VGAM359 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM359 host target proteins.

[4988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM359 gene, herein designated VGAM GENE, on one or more VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[4989] It is yet further appreciated that a function of VGAM359 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM359 correlate with, and may be deduced from, the identity of the host target genes which VGAM359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[4990] Nucleotide sequences of the VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM359 are further described hereinbelow with reference to Table 1.

[4991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM359 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[4992] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 360 (VGAM360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[4993] VGAM360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM360 was detected is described hereinabove with reference to Figs. 2–8.

[4994] VGAM360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[4995] VGAM360 gene, herein designated VGAM GENE, encodes a VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM360 precursor RNA is designated SEQ ID:346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:346 is located at position 11848 relative to the genome of Avian infectious bronchitis virus.

[4996] VGAM360 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4997] An enzyme complex designated DICER COMPLEX, dices the VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM360 RNA is designated SEQ ID:3071, and is provided hereinbelow with reference to the sequence listing part.

[4998] VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4999] VGAM360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM360 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5000] The complementary binding of VGAM360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5001] It is appreciated that VGAM360 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM360 host target genes. The mRNA of each one of this plurality of VGAM360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM360 RNA, herein designated VGAM RNA, and which when bound by VGAM360 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM360 host target proteins.

[5002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM360 gene, herein designated VGAM GENE, on one or more VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5003] It is yet further appreciated that a function of VGAM360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM360 correlate with, and may be deduced from, the identity of the host target genes which VGAM360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5004] Nucleotide sequences of the VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM360 are further described hereinbelow with reference to Table 1.

[5005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5006] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 361 (VGAM361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5007] VGAM361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM361 was detected is described hereinabove with reference to Figs. 2–8.

[5008] VGAM361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5009] VGAM361 gene, herein designated VGAM GENE, encodes a VGAM361 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM361 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM361 precursor RNA is designated SEQ ID:347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:347 is located at position 6715 relative to the genome of Avian infectious bronchitis virus.

[5010] VGAM361 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5011] An enzyme complex designated DICER COMPLEX, dices the VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM361 RNA is designated SEQ ID:3072, and is provided hereinbelow with reference to the sequence listing part.

[5012] VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5013] VGAM361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM361 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5014] The complementary binding of VGAM361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5015] It is appreciated that VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM361 host target genes. The mRNA of each one of this plurality of VGAM361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM361 RNA, herein designated VGAM RNA, and which when bound by VGAM361 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM361 host target proteins.

[5016] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM361 gene, herein designated VGAM GENE, on one or more VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5017] It is yet further appreciated that a function of VGAM361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM361 correlate with, and may be deduced from, the identity of the host target genes which VGAM361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5018] Nucleotide sequences of the VGAM361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM361 are further described hereinbelow with reference to Table 1.

[5019] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5020] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 362 (VGAM362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5021] VGAM362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM362 was detected is described hereinabove with reference to Figs. 2–8.

[5022] VGAM362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5023] VGAM362 gene, herein designated VGAM GENE, encodes a VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM362 precursor RNA is designated SEQ ID:348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:348 is located at position 4697 relative to the genome of Avian infectious bronchitis virus.

[5024] VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5025] An enzyme complex designated DICER COMPLEX, dices the VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM362 RNA is designated SEQ ID:3073, and is provided hereinbelow with reference to the sequence listing part.

[5026] VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5027] VGAM362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5028] The complementary binding of VGAM362 RNA, herein designated VGAM RNA, to host target binding sites on VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[5029] It is appreciated that VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM362 host target genes. The mRNA of each one of this plurality of VGAM362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM362 RNA, herein designated VGAM RNA, and which when bound by VGAM362 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM362 host target proteins.

[5030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM362 gene, herein designated VGAM GENE, on one or more VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5031] It is yet further appreciated that a function of VGAM362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM362 correlate with, and may be deduced from, the identity of the host target genes which VGAM362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5032] Nucleotide sequences of the VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM362 are further described hereinbelow with reference to Table 1.

[5033] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5034] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 363 (VGAM363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5035] VGAM363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM363 was detected is described hereinabove with reference to Figs. 2-8.

[5036] VGAM363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5037] VGAM363 gene, herein designated VGAM GENE, encodes a VGAM363 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM363 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM363 precursor RNA is designated SEQ ID:349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:349 is located at position 5806 relative to the genome of Avian infectious bronchitis virus.

[5038] VGAM363 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5039] An enzyme complex designated DICER COMPLEX, dices the VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM363 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM363 RNA is designated SEQ ID:3074, and is provided hereinbelow with reference to the sequence listing part.

[5040] VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5041] VGAM363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM363 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5042] The complementary binding of VGAM363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM363 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5043] It is appreciated that VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM363 host target genes. The mRNA of each one of this plurality of VGAM363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM363 RNA, herein designated VGAM RNA, and which when bound by VGAM363 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM363 host target proteins.

[5044] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM363 gene, herein designated VGAM GENE, on one or more VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5045] It is yet further appreciated that a function of VGAM363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM363 correlate with, and may be deduced from, the identity of the host target genes which VGAM363 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5046] Nucleotide sequences of the VGAM363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM363 are further described hereinbelow with reference to Table 1.

[5047] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM363 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5048] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 364 (VGAM364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5049] VGAM364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM364 was detected is described hereinabove with reference to Figs. 2-8.

[5050] VGAM364 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5051] VGAM364 gene, herein designated VGAM GENE, encodes a

VGAM364 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM364 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM364 precursor RNA is designated SEQ ID:350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:350 is located at position 10866 relative to the genome of Avian infectious bronchitis virus.

[5052] VGAM364 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5053] An enzyme complex designated DICER COMPLEX, dices the VGAM364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM364 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM364 RNA is designated SEQ ID:3075, and is provided hereinbelow with reference to the sequence listing part.

[5054] VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5055] VGAM364 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM364 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5056] The complementary binding of VGAM364 RNA, herein designated VGAM RNA, to host target binding sites on VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM364 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5057] It is appreciated that VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM364 host target genes. The mRNA of each one of this plurality of VGAM364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM364 RNA, herein designated VGAM RNA, and which when bound by VGAM364 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM364 host target proteins.

[5058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM364 gene, herein designated VGAM GENE, on one or more VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5059] It is yet further appreciated that a function of VGAM364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM364 correlate with, and may be deduced from, the identity of the host target genes which VGAM364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5060] Nucleotide sequences of the VGAM364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM364 are further de-

scribed hereinbelow with reference to Table 1.

[5061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM364 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5062] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 365 (VGAM365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5063] VGAM365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM365 was detected is described hereinabove with reference to Figs. 2-8.

[5064] VGAM365 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5065] VGAM365 gene, herein designated VGAM GENE, encodes a VGAM365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM365 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM365 precursor RNA is designated SEQ ID:351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:351 is located at position 21704 relative to the genome of Avian infectious bronchitis virus.

[5066] VGAM365 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5067] An enzyme complex designated DICER COMPLEX, dices the VGAM365 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM365 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM365 RNA is designated SEQ ID:3076, and is provided hereinbelow with reference to the sequence listing part.

[5068] VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5069] VGAM365 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM365 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5070] The complementary binding of VGAM365 RNA, herein designated VGAM RNA, to host target binding sites on VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM365 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5071] It is appreciated that VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM365 host target genes. The mRNA of each one of this plurality of VGAM365 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM365 RNA, herein designated VGAM RNA, and which when bound by VGAM365 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM365 host target proteins.

[5072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM365 gene, herein designated VGAM GENE, on one or more VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5073] It is yet further appreciated that a function of VGAM365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM365 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM365 correlate with, and may be deduced from, the identity of the host target genes which VGAM365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5074] Nucleotide sequences of the VGAM365 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM365 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM365 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM365 are further described hereinbelow with reference to Table 1.

[5075] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5076] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 366 (VGAM366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5077] VGAM366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM366 was detected is described hereinabove with reference to Figs. 2-8.

[5078] VGAM366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[5079] VGAM366 gene, herein designated VGAM GENE, encodes a VGAM366 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM366 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM366 precursor RNA is designated SEQ ID:352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:352 is located at position 23096 relative to the genome of Avian infectious bronchitis virus.

[5080] VGAM366 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5081] An enzyme complex designated DICER COMPLEX, dices

the VGAM366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM366 RNA is designated SEQ ID:3077, and is provided hereinbelow with reference to the sequence listing part.

[5082] VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5083] VGAM366 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM366 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5084] The complementary binding of VGAM366 RNA, herein designated VGAM RNA, to host target binding sites on VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5085] It is appreciated that VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM366 host target genes. The mRNA of each one of this plurality of VGAM366 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM366 RNA, herein designated VGAM RNA, and which when bound by VGAM366 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM366 host target proteins.

[5086] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM366 gene, herein designated VGAM GENE, on one or more VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5087] It is yet further appreciated that a function of VGAM366 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM366 correlate with, and may be deduced from, the identity of the host target genes which VGAM366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5088] Nucleotide sequences of the VGAM366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM366 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM366 are further described hereinbelow with reference to Table 1.

[5089] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5090] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 367 (VGAM367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5091] VGAM367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM367 was detected is described hereinabove with reference to Figs. 2-8.

[5092] VGAM367 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM367 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5093] VGAM367 gene, herein designated VGAM GENE, encodes a VGAM367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM367 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM367 precursor RNA is designated SEQ ID:353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:353 is located at position 22094 relative to the genome of Avian infectious bronchitis virus.

[5094] VGAM367 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5095] An enzyme complex designated DICER COMPLEX, dices the VGAM367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM367 RNA is designated SEQ ID:3078, and is provided hereinbelow with reference to the sequence listing part.

[5096] VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5097] VGAM367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM367 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5098] The complementary binding of VGAM367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM367 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5099] It is appreciated that VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM367 host target genes. The mRNA of each one of this plurality of VGAM367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM367 RNA, herein designated VGAM RNA, and which when bound by VGAM367 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM367 host target proteins.

[5100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM367 gene, herein designated VGAM GENE, on one or more VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5101] It is yet further appreciated that a function of VGAM367 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM367 correlate with, and may be deduced from, the identity of the host target genes which VGAM367 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5102] Nucleotide sequences of the VGAM367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM367 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM367 are further described hereinbelow with reference to Table 1.

[5103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5104] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 368 (VGAM368) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5105] VGAM368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM368 was detected is described hereinabove with reference to Figs. 2-8.

[5106] VGAM368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bron-

chitis virus. VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5107] VGAM368 gene, herein designated VGAM GENE, encodes a VGAM368 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM368 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM368 precursor RNA is designated SEQ ID:354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:354 is located at position 22912 relative to the genome of Avian infectious bronchitis virus.

[5108] VGAM368 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

- [5109] An enzyme complex designated DICER COMPLEX, dices the VGAM368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM368 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM368 RNA is designated SEQ ID:3079, and is provided hereinbelow with reference to the sequence listing part.
- [5110] VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [5111] VGAM368 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM368 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5112] The complementary binding of VGAM368 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM368 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5113] It is appreciated that VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM368 host target genes. The mRNA of each one of this plurality of VGAM368 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM368 RNA, herein designated VGAM RNA, and which when bound by VGAM368 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM368 host target proteins.

[5114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM368 gene, herein designated VGAM GENE, on one or more VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5115] It is yet further appreciated that a function of VGAM368 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of

VGAM368 correlate with, and may be deduced from, the identity of the host target genes which VGAM368 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5116] Nucleotide sequences of the VGAM368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM368 are further described hereinbelow with reference to Table 1.

[5117] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5118] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 369 (VGAM369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[5119] VGAM369 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM369 was detected is described hereinabove with reference to Figs. 2–8.

[5120] VGAM369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5121] VGAM369 gene, herein designated VGAM GENE, encodes a VGAM369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM369 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM369 precursor RNA is designated SEQ ID:355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:355 is located at position 16684 relative to the genome of Avian infectious bronchitis virus.

[5122] VGAM369 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM369 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5123] An enzyme complex designated DICER COMPLEX, dices the VGAM369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM369 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM369 RNA is designated SEQ ID:3080, and is provided hereinbelow with reference to the sequence listing part.

[5124] VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM369 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5125] VGAM369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5126] The complementary binding of VGAM369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5127] It is appreciated that VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM369 host target genes. The mRNA of each one of this plurality of VGAM369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM369 RNA, herein designated VGAM RNA, and which when bound by VGAM369 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM369 host target proteins.

[5128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM369 gene, herein designated VGAM GENE, on one or more VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5129] It is yet further appreciated that a function of VGAM369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis

virus. Specific functions, and accordingly utilities, of VGAM369 correlate with, and may be deduced from, the identity of the host target genes which VGAM369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5130] Nucleotide sequences of the VGAM369 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM369 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM369 are further described hereinbelow with reference to Table 1.

[5131] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM369 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5132] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 370 (VGAM370) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[5133] VGAM370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM370 was detected is described hereinabove with reference to Figs. 2–8.

[5134] VGAM370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5135] VGAM370 gene, herein designated VGAM GENE, encodes a VGAM370 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM370 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM370 precursor RNA is designated SEQ ID:356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:356 is located at position 17287 relative to the genome of Avian infectious bronchitis virus.

[5136] VGAM370 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5137] An enzyme complex designated DICER COMPLEX, dices the VGAM370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM370 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM370 RNA is designated SEQ ID:3081, and is provided hereinbelow with reference to the sequence listing part.

[5138] VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5139] VGAM370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM370 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM370 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5140] The complementary binding of VGAM370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5141] It is appreciated that VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM370 host target genes. The mRNA of each one of this plurality of VGAM370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM370 RNA, herein designated VGAM RNA, and which when bound by VGAM370 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM370 host target proteins.

[5142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM370 gene, herein designated VGAM GENE, on one or more VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5143] It is yet further appreciated that a function of VGAM370 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM370 include diagnosis, prevention and

treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM370 correlate with, and may be deduced from, the identity of the host target genes which VGAM370 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5144] Nucleotide sequences of the VGAM370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM370 are further described hereinbelow with reference to Table 1.

[5145] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5146] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 371 (VGAM371) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5147] VGAM371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM371 was detected is described hereinabove with reference to Figs. 2–8.

[5148] VGAM371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5149] VGAM371 gene, herein designated VGAM GENE, encodes a VGAM371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM371 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM371 precursor RNA is designated SEQ ID:357, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:357 is located at position 16829 relative to the genome of Avian infectious bronchitis virus.

[5150] VGAM371 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5151] An enzyme complex designated DICER COMPLEX, dices the VGAM371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM371 RNA is designated SEQ ID:3082, and is provided hereinbelow with reference to the sequence listing part.

[5152] VGAM371 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5153] VGAM371 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM371 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM371 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5154] The complementary binding of VGAM371 RNA, herein designated VGAM RNA, to host target binding sites on VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM371 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5155] It is appreciated that VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM371 host target genes. The mRNA of each one of this plurality of VGAM371 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM371 RNA, herein designated VGAM

RNA, and which when bound by VGAM371 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM371 host target proteins.

[5156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM371 gene, herein designated VGAM GENE, on one or more VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5157] It is yet further appreciated that a function of VGAM371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM371 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM371 correlate with, and may be deduced from, the identity of the host target genes which VGAM371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5158] Nucleotide sequences of the VGAM371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM371 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM371 are further described hereinbelow with reference to Table 1.

[5159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM371 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5160] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 372 (VGAM372) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5161] VGAM372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM372 was detected is described hereinabove with reference to Figs. 2–8.

[5162] VGAM372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5163] VGAM372 gene, herein designated VGAM GENE, encodes a VGAM372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM372 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM372 precursor RNA is designated SEQ ID:358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:358 is located at position 11416 relative to

the genome of Avian infectious bronchitis virus.

[5164] VGAM372 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5165] An enzyme complex designated DICER COMPLEX, dices the VGAM372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM372 RNA is designated SEQ ID:3083, and is provided hereinbelow with reference to the sequence listing part.

[5166] VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5167] VGAM372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM372 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5168] The complementary binding of VGAM372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5169] It is appreciated that VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM372 host target genes. The mRNA of each one of this plurality of VGAM372 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM372 RNA, herein designated VGAM RNA, and which when bound by VGAM372 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM372 host target proteins.

[5170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM372 gene, herein designated VGAM GENE, on one or more VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5171] It is yet further appreciated that a function of VGAM372 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM372 correlate with, and may be deduced from, the identity of the host target genes which VGAM372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5172] Nucleotide sequences of the VGAM372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM372 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM372 are further described hereinbelow with reference to Table 1.

[5173] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM372 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5174] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 373 (VGAM373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5175] VGAM373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM373 was detected is described hereinabove with reference to Figs. 2–8.

[5176] VGAM373 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5177] VGAM373 gene, herein designated VGAM GENE, encodes a VGAM373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM373 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM373 precursor RNA is designated SEQ ID:359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:359 is located at position 14350 relative to the genome of Avian infectious bronchitis virus.

[5178] VGAM373 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5179] An enzyme complex designated DICER COMPLEX, dices the VGAM373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM373 RNA is designated SEQ ID:3084, and is provided hereinbelow with reference to the sequence

listing part.

[5180] VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5181] VGAM373 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5182] The complementary binding of VGAM373 RNA, herein designated VGAM RNA, to host target binding sites on VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5183] It is appreciated that VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM373 host target genes. The mRNA of each one of this plurality of VGAM373 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM373 RNA, herein designated VGAM RNA, and which when bound by VGAM373 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM373 host target proteins.

[5184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM373 gene, herein designated VGAM GENE, on one or more VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5185] It is yet further appreciated that a function of VGAM373 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM373 correlate with, and may be deduced from, the identity of the host target genes which VGAM373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5186] Nucleotide sequences of the VGAM373 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM373 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM373 are further described hereinbelow with reference to Table 1.

[5187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM373 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5188] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 374 (VGAM374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5189] VGAM374 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM374 was detected is described hereinabove with reference to Figs. 2–8.

[5190] VGAM374 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5191] VGAM374 gene, herein designated VGAM GENE, encodes a VGAM374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM374 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM374 precursor RNA is designated SEQ ID:360, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:360 is located at position 13667 relative to the genome of Avian infectious bronchitis virus.

[5192] VGAM374 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5193] An enzyme complex designated DICER COMPLEX, dices the VGAM374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM374 RNA is designated SEQ ID:3085, and

is provided hereinbelow with reference to the sequence listing part.

[5194] VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5195] VGAM374 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5196] The complementary binding of VGAM374 RNA, herein designated VGAM RNA, to host target binding sites on VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5197] It is appreciated that VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM374 host target genes. The mRNA of each one of this plurality of VGAM374 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM374 RNA, herein designated VGAM RNA, and which when bound by VGAM374 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM374 host target proteins.

[5198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM374 gene, herein designated VGAM GENE, on one or more VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5199] It is yet further appreciated that a function of VGAM374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM374 correlate with, and may be deduced from, the identity of the host target genes which VGAM374 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5200] Nucleotide sequences of the VGAM374 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM374 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM374 are further described hereinbelow with reference to Table 1.

[5201] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM374 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5202] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 375 (VGAM375) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5203] VGAM375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM375 was detected is described hereinabove with reference to Figs. 2–8.

[5204] VGAM375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian infectious bronchitis virus. VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5205] VGAM375 gene, herein designated VGAM GENE, encodes a VGAM375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM375 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM375 precursor RNA is

designated SEQ ID:361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:361 is located at position 19796 relative to the genome of Avian infectious bronchitis virus.

[5206] VGAM375 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5207] An enzyme complex designated DICER COMPLEX, dices the VGAM375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide se-

quence of VGAM375 RNA is designated SEQ ID:3086, and is provided hereinbelow with reference to the sequence listing part.

[5208] VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5209] VGAM375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5210] The complementary binding of VGAM375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5211] It is appreciated that VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM375 host target genes. The mRNA of

each one of this plurality of VGAM375 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM375 RNA, herein designated VGAM RNA, and which when bound by VGAM375 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM375 host target proteins.

[5212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM375 gene, herein designated VGAM GENE, on one or more VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[5213] It is yet further appreciated that a function of VGAM375 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of viral infection by Avian infectious bronchitis virus. Specific functions, and accordingly utilities, of VGAM375 correlate with, and may be deduced from, the identity of the host target genes which VGAM375 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5214] Nucleotide sequences of the VGAM375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM375 are further described hereinbelow with reference to Table 1.

[5215] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM375 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[5216] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 376 (VGAM376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5217] VGAM376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM376 was detected is described hereinabove with reference to Figs. 2–8.

[5218] VGAM376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Eggplant mosaic virus. VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5219] VGAM376 gene, herein designated VGAM GENE, encodes a VGAM376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM376 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM376 precursor RNA is designated SEQ ID:362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:362 is located at position 1184 relative to the genome of Eggplant mosaic virus.

[5220] VGAM376 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5221] An enzyme complex designated DICER COMPLEX, dices the VGAM376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM376 RNA is designated SEQ ID:3087, and is provided hereinbelow with reference to the sequence listing part.

[5222] VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5223] VGAM376 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM376 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5224] The complementary binding of VGAM376 RNA, herein designated VGAM RNA, to host target binding sites on VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5225] It is appreciated that VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM376 host target genes. The mRNA of each one of this plurality of VGAM376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM376 RNA, herein designated VGAM RNA, and which when bound by VGAM376 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM376 host target proteins.

[5226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM376 gene, herein designated VGAM GENE, on one or more VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[5227] It is yet further appreciated that a function of VGAM376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of viral infection by Eggplant mosaic virus. Specific functions, and accordingly utilities, of VGAM376 correlate with, and may be deduced from, the identity of the host target genes which VGAM376 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5228] Nucleotide sequences of the VGAM376 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM376 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM376 are further described hereinbelow with reference to Table 1.

[5229] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5230] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 377 (VGAM377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5231] VGAM377 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM377 was detected is described hereinabove with reference to Figs. 2–8.

[5232] VGAM377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Eggplant mosaic virus. VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5233] VGAM377 gene, herein designated VGAM GENE, encodes a VGAM377 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM377 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM377 precursor RNA is designated SEQ ID:363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:363 is located at position 2809 relative to the genome of Eggplant mosaic virus.

[5234] VGAM377 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5235] An enzyme complex designated DICER COMPLEX, dices the VGAM377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM377 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM377 RNA is designated SEQ ID:3088, and is provided hereinbelow with reference to the sequence listing part.

[5236] VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5237] VGAM377 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5238] The complementary binding of VGAM377 RNA, herein designated VGAM RNA, to host target binding sites on VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5239] It is appreciated that VGAM377 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM377 host target genes. The mRNA of each one of this plurality of VGAM377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM377 RNA, herein designated VGAM RNA, and which when bound by VGAM377 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM377 host target proteins.

[5240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM377 gene, herein designated VGAM GENE, on one or more VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5241] It is yet further appreciated that a function of VGAM377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of viral infection by Eggplant mosaic virus. Specific functions, and accordingly utilities, of VGAM377 correlate with, and may be deduced from, the identity of the host target genes which VGAM377 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5242] Nucleotide sequences of the VGAM377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM377 are further described hereinbelow with reference to Table 1.

[5243] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM377 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5244] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 378 (VGAM378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5245] VGAM378 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM378 was detected is described hereinabove with reference to Figs. 2–8.

[5246] VGAM378 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5247] VGAM378 gene, herein designated VGAM GENE, encodes a VGAM378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM378 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM378 precursor RNA is designated SEQ ID:364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:364 is located at position 7329 relative to the genome of Feline immunodeficiency virus.

[5248] VGAM378 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5249] An enzyme complex designated DICER COMPLEX, dices the VGAM378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM378 RNA is designated SEQ ID:3089, and is provided hereinbelow with reference to the sequence listing part.

[5250] VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5251] VGAM378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM378 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5252] The complementary binding of VGAM378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5253] It is appreciated that VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM378 host target genes. The mRNA of each one of this plurality of VGAM378 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM378 RNA, herein designated VGAM RNA, and which when bound by VGAM378 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM378 host target proteins.

[5254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM378 gene, herein designated VGAM GENE, on one or more VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5255] It is yet further appreciated that a function of VGAM378 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM378 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM378 correlate with, and may be deduced from, the identity of the host target genes which VGAM378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5256] Nucleotide sequences of the VGAM378 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM378 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM378 are further described hereinbelow with reference to Table 1.

[5257] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5258] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 379 (VGAM379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5259] VGAM379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM379 was detected is described hereinabove with reference to Figs. 2–8.

[5260] VGAM379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5261] VGAM379 gene, herein designated VGAM GENE, encodes a VGAM379 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM379 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM379 precursor RNA is designated SEQ ID:365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:365 is located at position 7178 relative to the genome of Feline immunodeficiency virus.

[5262] VGAM379 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5263] An enzyme complex designated DICER COMPLEX, dices the VGAM379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM379 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM379 RNA is designated SEQ ID:3090, and is provided hereinbelow with reference to the sequence listing part.

[5264] VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5265] VGAM379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5266] The complementary binding of VGAM379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[5267] It is appreciated that VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM379 host target genes. The mRNA of each one of this plurality of VGAM379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM379 RNA, herein designated VGAM RNA, and which when bound by VGAM379 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM379 host target proteins.

[5268] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM379 gene, herein designated VGAM GENE, on one or more VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5269] It is yet further appreciated that a function of VGAM379 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM379 correlate with, and may be deduced from, the identity of the host target genes which VGAM379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5270] Nucleotide sequences of the VGAM379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM379 are further described hereinbelow with reference to Table 1.

[5271] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5272] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 380 (VGAM380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5273] VGAM380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM380 was detected is described hereinabove with reference to Figs. 2-8.

[5274] VGAM380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5275] VGAM380 gene, herein designated VGAM GENE, encodes a VGAM380 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM380 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM380 precursor RNA is designated SEQ ID:366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:366 is located at position 8388 relative to the genome of Feline immunodeficiency virus.

[5276] VGAM380 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5277] An enzyme complex designated DICER COMPLEX, dices the VGAM380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM380 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM380 RNA is designated SEQ ID:3091, and is provided hereinbelow with reference to the sequence listing part.

[5278] VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5279] VGAM380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM380 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM380 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5280] The complementary binding of VGAM380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM380 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5281] It is appreciated that VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM380 host target genes. The mRNA of each one of this plurality of VGAM380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM380 RNA, herein designated VGAM RNA, and which when bound by VGAM380 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM380 host target proteins.

[5282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM380 gene, herein designated VGAM GENE, on one or more VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5283] It is yet further appreciated that a function of VGAM380 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM380 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM380 correlate with, and may be deduced from, the identity of the host target genes which VGAM380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5284] Nucleotide sequences of the VGAM380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM380 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM380 are further described hereinbelow with reference to Table 1.

[5285] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5286] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 381 (VGAM381) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5287] VGAM381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM381 was detected is described hereinabove with reference to Figs. 2-8.

[5288] VGAM381 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5289] VGAM381 gene, herein designated VGAM GENE, encodes a

VGAM381 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM381 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM381 precursor RNA is designated SEQ ID:367, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:367 is located at position 8564 relative to the genome of Feline immunodeficiency virus.

[5290] VGAM381 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5291] An enzyme complex designated DICER COMPLEX, dices the VGAM381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM381 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM381 RNA is designated SEQ ID:3092, and is provided hereinbelow with reference to the sequence listing part.

[5292] VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5293] VGAM381 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM381 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM381 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5294] The complementary binding of VGAM381 RNA, herein designated VGAM RNA, to host target binding sites on VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5295] It is appreciated that VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM381 host target genes. The mRNA of each one of this plurality of VGAM381 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM381 RNA, herein designated VGAM RNA, and which when bound by VGAM381 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM381 host target proteins.

[5296] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM381 gene, herein designated VGAM GENE, on one or more VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5297] It is yet further appreciated that a function of VGAM381 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM381 correlate with, and may be deduced from, the identity of the host target genes which VGAM381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5298] Nucleotide sequences of the VGAM381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM381 are further de-

scribed hereinbelow with reference to Table 1.

[5299] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5300] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 382 (VGAM382) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5301] VGAM382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM382 was detected is described hereinabove with reference to Figs. 2-8.

[5302] VGAM382 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A virus. VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5303] VGAM382 gene, herein designated VGAM GENE, encodes a VGAM382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM382 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM382 precursor RNA is designated SEQ ID:368, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:368 is located at position 4814 relative to the genome of Hepatitis A virus.

[5304] VGAM382 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5305] An enzyme complex designated DICER COMPLEX, dices the VGAM382 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM382 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM382 RNA is designated SEQ ID:3093, and is provided hereinbelow with reference to the sequence listing part.

[5306] VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5307] VGAM382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM382 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM382 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5308] The complementary binding of VGAM382 RNA, herein designated VGAM RNA, to host target binding sites on VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM382 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM382 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5309] It is appreciated that VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM382 host target genes. The mRNA of each one of this plurality of VGAM382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM382 RNA, herein designated VGAM RNA, and which when bound by VGAM382 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM382 host target proteins.

[5310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM382 gene, herein designated VGAM GENE, on one or more VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5311] It is yet further appreciated that a function of VGAM382 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM382 include diagnosis, prevention and treatment of viral infection by Hepatitis A virus. Specific functions, and accordingly utilities, of VGAM382 correlate with, and may be deduced from, the identity of the host target genes which VGAM382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5312] Nucleotide sequences of the VGAM382 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM382 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM382 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM382 are further described hereinbelow with reference to Table 1.

[5313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM382 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5314] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 383 (VGAM383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5315] VGAM383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM383 was detected is described hereinabove with reference to Figs. 2-8.

[5316] VGAM383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A virus. VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[5317] VGAM383 gene, herein designated VGAM GENE, encodes a VGAM383 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM383 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM383 precursor RNA is designated SEQ ID:369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:369 is located at position 6678 relative to the genome of Hepatitis A virus.

[5318] VGAM383 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5319] An enzyme complex designated DICER COMPLEX, dices

the VGAM383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM383 RNA is designated SEQ ID:3094, and is provided hereinbelow with reference to the sequence listing part.

[5320] VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5321] VGAM383 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM383 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM383 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5322] The complementary binding of VGAM383 RNA, herein designated VGAM RNA, to host target binding sites on VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5323] It is appreciated that VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM383 host target genes. The mRNA of each one of this plurality of VGAM383 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM383 RNA, herein designated VGAM RNA, and which when bound by VGAM383 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM383 host target proteins.

[5324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM383 gene, herein designated VGAM GENE, on one or more VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5325] It is yet further appreciated that a function of VGAM383 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of viral infection by Hepatitis A virus. Specific functions, and accordingly utilities, of VGAM383 correlate with, and may be deduced from, the identity of the host target genes which VGAM383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5326] Nucleotide sequences of the VGAM383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM383 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM383 are further described hereinbelow with reference to Table 1.

[5327] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM383 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5328] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 384 (VGAM384) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5329] VGAM384 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM384 was detected is described hereinabove with reference to Figs. 2-8.

[5330] VGAM384 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A virus. VGAM384 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[5331] VGAM384 gene, herein designated VGAM GENE, encodes a VGAM384 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM384 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM384 precursor RNA is designated SEQ ID:370, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:370 is located at position 5499 relative to the genome of Hepatitis A virus.

[5332] VGAM384 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5333] An enzyme complex designated DICER COMPLEX, dices the VGAM384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM384 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM384 RNA is designated SEQ ID:3095, and is provided hereinbelow with reference to the sequence listing part.

[5334] VGAM384 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM384 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM384 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5335] VGAM384 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM384 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM384 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM384 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM384 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5336] The complementary binding of VGAM384 RNA, herein designated VGAM RNA, to host target binding sites on VGAM384 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM384 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM384 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5337] It is appreciated that VGAM384 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM384 host target genes. The mRNA of each one of this plurality of VGAM384 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM384 RNA, herein designated VGAM RNA, and which when bound by VGAM384 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM384 host target proteins.

[5338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM384 gene, herein designated VGAM GENE, on one or more VGAM384 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5339] It is yet further appreciated that a function of VGAM384 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM384 include diagnosis, prevention and treatment of viral infection by Hepatitis A virus. Specific functions, and accordingly utilities, of VGAM384 correlate with, and may be deduced from, the identity of the host target genes which VGAM384 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5340] Nucleotide sequences of the VGAM384 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM384 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM384 are further described hereinbelow with reference to Table 1.

[5341] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM384 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5342] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 385 (VGAM385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5343] VGAM385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM385 was detected is described hereinabove with reference to Figs. 2-8.

[5344] VGAM385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A virus.

VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5345] VGAM385 gene, herein designated VGAM GENE, encodes a VGAM385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM385 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM385 precursor RNA is designated SEQ ID:371, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:371 is located at position 3807 relative to the genome of Hepatitis A virus.

[5346] VGAM385 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[5347] An enzyme complex designated DICER COMPLEX, dices the VGAM385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM385 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM385 RNA is designated SEQ ID:3096, and is provided hereinbelow with reference to the sequence listing part.

[5348] VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5349] VGAM385 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM385 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5350] The complementary binding of VGAM385 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5351] It is appreciated that VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM385 host target genes. The mRNA of each one of this plurality of VGAM385 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM385 RNA, herein designated VGAM RNA, and which when bound by VGAM385 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM385 host target proteins.

[5352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM385 gene, herein designated VGAM GENE, on one or more VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5353] It is yet further appreciated that a function of VGAM385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of viral infection by Hepatitis A virus. Specific functions, and accordingly utilities, of VGAM385 correlate with, and may be deduced from, the identity of the host target genes which VGAM385 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5354] Nucleotide sequences of the VGAM385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM385 are further described hereinbelow with reference to Table 1.

[5355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM385 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5356] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 386 (VGAM386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5357] VGAM386 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM386 was detected is described hereinabove with reference to Figs. 2-8.

[5358] VGAM386 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Hepatitis A virus.

VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5359] VGAM386 gene, herein designated VGAM GENE, encodes a VGAM386 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM386 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM386 precursor RNA is designated SEQ ID:372, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:372 is located at position 1168 relative to the genome of Hepatitis A virus.

[5360] VGAM386 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5361] An enzyme complex designated DICER COMPLEX, dices the VGAM386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM386 RNA is designated SEQ ID:3097, and is provided hereinbelow with reference to the sequence listing part.

[5362] VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5363] VGAM386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5364] The complementary binding of VGAM386 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5365] It is appreciated that VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM386 host target genes. The mRNA of each one of this plurality of VGAM386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM386 RNA, herein designated VGAM RNA, and which when bound by VGAM386 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM386 host target proteins.

[5366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM386 gene, herein designated VGAM GENE, on one or more VGAM386 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5367] It is yet further appreciated that a function of VGAM386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of viral infection by Hepatitis A virus. Specific functions, and accordingly utilities, of VGAM386 correlate with, and may be deduced from, the identity of the host target genes which VGAM386 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5368] Nucleotide sequences of the VGAM386 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM386 are further described hereinbelow with reference to Table 1.

[5369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM386 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5370] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 387 (VGAM387) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5371] VGAM387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM387 was detected is described hereinabove with reference to Figs. 2-8.

[5372] VGAM387 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5373] VGAM387 gene, herein designated VGAM GENE, encodes a VGAM387 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM387 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM387 precursor RNA is designated SEQ ID:373, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:373 is located at position 97453 relative to the genome of Equine herpesvirus 1.

[5374] VGAM387 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5375] An enzyme complex designated DICER COMPLEX, dices the VGAM387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM387 RNA is designated SEQ ID:3098, and is provided hereinbelow with reference to the sequence listing part.

[5376] VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[5377] VGAM387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM387 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5378] The complementary binding of VGAM387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5379] It is appreciated that VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM387 host target genes. The mRNA of each one of this plurality of VGAM387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM387 RNA, herein designated VGAM RNA, and which when bound by VGAM387 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM387 host target proteins.

[5380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM387 gene, herein designated VGAM GENE, on one or

more VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5381] It is yet further appreciated that a function of VGAM387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM387 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM387 correlate with, and may be deduced from, the identity of the host target genes which VGAM387 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5382] Nucleotide sequences of the VGAM387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM387 are further described hereinbelow with reference to Table 1.

[5383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM387 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5384] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 388 (VGAM388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5385] VGAM388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM388 was detected is described

hereinabove with reference to Figs. 2–8.

[5386] VGAM388 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5387] VGAM388 gene, herein designated VGAM GENE, encodes a VGAM388 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM388 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM388 precursor RNA is designated SEQ ID:374, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:374 is located at position 97176 relative to the genome of Equine herpesvirus 1.

[5388] VGAM388 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5389] An enzyme complex designated DICER COMPLEX, dices the VGAM388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM388 RNA is designated SEQ ID:3099, and is provided hereinbelow with reference to the sequence listing part.

[5390] VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5391] VGAM388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM388 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[5392] The complementary binding of VGAM388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5393] It is appreciated that VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM388 host target genes. The mRNA of each one of this plurality of VGAM388 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM388 RNA, herein designated VGAM RNA, and which when bound by VGAM388 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM388 host target proteins.

[5394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM388 gene, herein designated VGAM GENE, on one or more VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5395] It is yet further appreciated that a function of VGAM388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM388 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM388 correlate with, and may be deduced from, the identity of the host target genes which VGAM388 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[5396] Nucleotide sequences of the VGAM388 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM388 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM388 are further described hereinbelow with reference to Table 1.

[5397] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM388 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5398] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 389 (VGAM389) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5399] VGAM389 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM389 was detected is described hereinabove with reference to Figs. 2–8.

[5400] VGAM389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5401] VGAM389 gene, herein designated VGAM GENE, encodes a VGAM389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM389 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM389 precursor RNA is designated SEQ ID:375, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:375 is located at position 99186 relative to the genome of Equine herpesvirus 1.

[5402] VGAM389 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5403] An enzyme complex designated DICER COMPLEX, dices the VGAM389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM389 RNA is designated SEQ ID:3100, and is provided hereinbelow with reference to the sequence listing part.

[5404] VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5405] VGAM389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM389 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5406] The complementary binding of VGAM389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5407] It is appreciated that VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM389 host target genes. The mRNA of each one of this plurality of VGAM389 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM389 RNA, herein designated VGAM RNA, and which when bound by VGAM389 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM389 host target proteins.

[5408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM389 gene, herein designated VGAM GENE, on one or more VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5409] It is yet further appreciated that a function of VGAM389 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM389 correlate with, and may be deduced from, the identity of the host target genes which VGAM389 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[5410] Nucleotide sequences of the VGAM389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM389 are further described hereinbelow with reference to Table 1.

[5411] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5412] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 390 (VGAM390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5413] VGAM390 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM390 was detected is described hereinabove with reference to Figs. 2–8.

[5414] VGAM390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5415] VGAM390 gene, herein designated VGAM GENE, encodes a VGAM390 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM390 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM390 precursor RNA is designated SEQ ID:376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:376 is located at position 98078 relative to the genome of Equine herpesvirus 1.

[5416] VGAM390 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5417] An enzyme complex designated DICER COMPLEX, dices the VGAM390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM390 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM390 RNA is designated SEQ ID:3101, and is provided hereinbelow with reference to the sequence listing part.

[5418] VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5419] VGAM390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM390 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5420] The complementary binding of VGAM390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5421] It is appreciated that VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM390 host target genes. The mRNA of each one of this plurality of VGAM390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM390 RNA, herein designated VGAM RNA, and which when bound by VGAM390 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM390 host target proteins.

[5422] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM390 gene, herein designated VGAM GENE, on one or more VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5423] It is yet further appreciated that a function of VGAM390 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM390 correlate with, and may be deduced from, the identity of the

host target genes which VGAM390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5424] Nucleotide sequences of the VGAM390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM390 are further described hereinbelow with reference to Table 1.

[5425] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5426] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 391 (VGAM391) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5427] VGAM391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM391 was detected is described hereinabove with reference to Figs. 2–8.

[5428] VGAM391 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5429] VGAM391 gene, herein designated VGAM GENE, encodes a VGAM391 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM391 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM391 precursor RNA is designated SEQ ID:377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:377 is located at position 98356 relative to the genome of Equine herpesvirus 1.

[5430] VGAM391 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM391 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5431] An enzyme complex designated DICER COMPLEX, dices the VGAM391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM391 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM391 RNA is designated SEQ ID:3102, and is provided hereinbelow with reference to the sequence listing part.

[5432] VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM391 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5433] VGAM391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM391 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5434] The complementary binding of VGAM391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM391 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5435] It is appreciated that VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM391 host target genes. The mRNA of each one of this plurality of VGAM391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM391 RNA, herein designated VGAM RNA, and which when bound by VGAM391 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM391 host target proteins.

[5436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM391 gene, herein designated VGAM GENE, on one or more VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5437] It is yet further appreciated that a function of VGAM391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM391 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5438] Nucleotide sequences of the VGAM391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM391 are further described hereinbelow with reference to Table 1.

[5439] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5440] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 392 (VGAM392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[5441] VGAM392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM392 was detected is described hereinabove with reference to Figs. 2–8.

[5442] VGAM392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5443] VGAM392 gene, herein designated VGAM GENE, encodes a VGAM392 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM392 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM392 precursor RNA is designated SEQ ID:378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:378 is located at position 104567 relative to the genome of Equine herpesvirus 1.

[5444] VGAM392 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM392 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5445] An enzyme complex designated DICER COMPLEX, dices the VGAM392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM392 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM392 RNA is designated SEQ ID:3103, and is provided hereinbelow with reference to the sequence listing part.

[5446] VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM392 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5447] VGAM392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM392 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM392 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5448] The complementary binding of VGAM392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5449] It is appreciated that VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM392 host target genes. The mRNA of each one of this plurality of VGAM392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM392 RNA, herein designated VGAM RNA, and which when bound by VGAM392 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM392 host target proteins.

[5450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM392 gene, herein designated VGAM GENE, on one or more VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5451] It is yet further appreciated that a function of VGAM392 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM392 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Spe-

cific functions, and accordingly utilities, of VGAM392 correlate with, and may be deduced from, the identity of the host target genes which VGAM392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5452] Nucleotide sequences of the VGAM392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM392 are further described hereinbelow with reference to Table 1.

[5453] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5454] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 393 (VGAM393) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[5455] VGAM393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM393 was detected is described hereinabove with reference to Figs. 2–8.

[5456] VGAM393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5457] VGAM393 gene, herein designated VGAM GENE, encodes a VGAM393 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM393 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM393 precursor RNA is designated SEQ ID:379, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:379 is located at position 4681 relative to the genome of Cryphonectria hypovirus 1.

[5458] VGAM393 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5459] An enzyme complex designated DICER COMPLEX, dices the VGAM393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM393 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM393 RNA is designated SEQ ID:3104, and is provided hereinbelow with reference to the sequence listing part.

[5460] VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5461] VGAM393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM393 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5462] The complementary binding of VGAM393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5463] It is appreciated that VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM393 host target genes. The mRNA of each one of this plurality of VGAM393 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM393 RNA, herein designated VGAM RNA, and which when bound by VGAM393 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM393 host target proteins.

[5464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM393 gene, herein designated VGAM GENE, on one or more VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5465] It is yet further appreciated that a function of VGAM393 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM393 include diagnosis, prevention and

treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM393 correlate with, and may be deduced from, the identity of the host target genes which VGAM393 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5466] Nucleotide sequences of the VGAM393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM393 are further described hereinbelow with reference to Table 1.

[5467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5468] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 394 (VGAM394) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5469] VGAM394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM394 was detected is described hereinabove with reference to Figs. 2–8.

[5470] VGAM394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5471] VGAM394 gene, herein designated VGAM GENE, encodes a VGAM394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM394 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM394 precursor RNA is designated SEQ ID:380, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:380 is located at position 4060 relative to the genome of Cryphonectria hypovirus 1.

[5472] VGAM394 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5473] An enzyme complex designated DICER COMPLEX, dices the VGAM394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM394 RNA is designated SEQ ID:3105, and is provided hereinbelow with reference to the sequence listing part.

[5474] VGAM394 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5475] VGAM394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM394 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5476] The complementary binding of VGAM394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5477] It is appreciated that VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM394 host target genes. The mRNA of each one of this plurality of VGAM394 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM394 RNA, herein designated VGAM

RNA, and which when bound by VGAM394 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM394 host target proteins.

[5478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM394 gene, herein designated VGAM GENE, on one or more VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5479] It is yet further appreciated that a function of VGAM394 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM394 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM394 correlate with, and may be deduced from, the identity of the host target genes which VGAM394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5480] Nucleotide sequences of the VGAM394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM394 are further described hereinbelow with reference to Table 1.

[5481] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM394 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5482] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 395 (VGAM395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5483] VGAM395 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM395 was detected is described hereinabove with reference to Figs. 2–8.

[5484] VGAM395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5485] VGAM395 gene, herein designated VGAM GENE, encodes a VGAM395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM395 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM395 precursor RNA is designated SEQ ID:381, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:381 is located at position 9833 relative to

the genome of Cryphonectria hypovirus 1.

[5486] VGAM395 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5487] An enzyme complex designated DICER COMPLEX, dices the VGAM395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM395 RNA is designated SEQ ID:3106, and is provided hereinbelow with reference to the sequence listing part.

[5488] VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5489] VGAM395 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM395 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM395 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5490] The complementary binding of VGAM395 RNA, herein designated VGAM RNA, to host target binding sites on VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5491] It is appreciated that VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM395 host target genes. The mRNA of each one of this plurality of VGAM395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM395 RNA, herein designated VGAM RNA, and which when bound by VGAM395 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM395 host target proteins.

[5492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM395 gene, herein designated VGAM GENE, on one or more VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5493] It is yet further appreciated that a function of VGAM395 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM395 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM395 correlate with, and may be deduced from, the identity of the host target genes which VGAM395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5494] Nucleotide sequences of the VGAM395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM395 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM395 are further described hereinbelow with reference to Table 1.

[5495] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5496] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 396 (VGAM396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5497] VGAM396 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM396 was detected is described hereinabove with reference to Figs. 2–8.

[5498] VGAM396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5499] VGAM396 gene, herein designated VGAM GENE, encodes a VGAM396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM396 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM396 precursor RNA is designated SEQ ID:382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:382 is located at position 2659 relative to the genome of Cryphonectria hypovirus 1.

[5500] VGAM396 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5501] An enzyme complex designated DICER COMPLEX, dices the VGAM396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM396 RNA is designated SEQ ID:3107, and is provided hereinbelow with reference to the sequence

listing part.

[5502] VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5503] VGAM396 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM396 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5504] The complementary binding of VGAM396 RNA, herein designated VGAM RNA, to host target binding sites on VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5505] It is appreciated that VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM396 host target genes. The mRNA of each one of this plurality of VGAM396 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM396 RNA, herein designated VGAM RNA, and which when bound by VGAM396 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM396 host target proteins.

[5506] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM396 gene, herein designated VGAM GENE, on one or more VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5507] It is yet further appreciated that a function of VGAM396 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM396 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM396 correlate with, and may be deduced from, the identity of the host target genes which VGAM396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5508] Nucleotide sequences of the VGAM396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM396 are further described hereinbelow with reference to Table 1.

[5509] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5510] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 397 (VGAM397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5511] VGAM397 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM397 was detected is described hereinabove with reference to Figs. 2–8.

[5512] VGAM397 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5513] VGAM397 gene, herein designated VGAM GENE, encodes a VGAM397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM397 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM397 precursor RNA is designated SEQ ID:383, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:383 is located at position 5663 relative to the genome of Cryphonectria hypovirus 1.

[5514] VGAM397 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5515] An enzyme complex designated DICER COMPLEX, dices the VGAM397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM397 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM397 RNA is designated SEQ ID:3108, and

is provided hereinbelow with reference to the sequence listing part.

[5516] VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5517] VGAM397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5518] The complementary binding of VGAM397 RNA, herein designated VGAM RNA, to host target binding sites on VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM397 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5519] It is appreciated that VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM397 host target genes. The mRNA of each one of this plurality of VGAM397 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM397 RNA, herein designated VGAM RNA, and which when bound by VGAM397 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM397 host target proteins.

[5520] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM397 gene, herein designated VGAM GENE, on one or more VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5521] It is yet further appreciated that a function of VGAM397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM397 correlate with, and may be deduced from, the identity of the host target genes which VGAM397 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5522] Nucleotide sequences of the VGAM397 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM397 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM397 are further described hereinbelow with reference to Table 1.

[5523] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM397 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5524] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 398 (VGAM398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5525] VGAM398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM398 was detected is described hereinabove with reference to Figs. 2–8.

[5526] VGAM398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5527] VGAM398 gene, herein designated VGAM GENE, encodes a VGAM398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM398 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM398 precursor RNA is

designated SEQ ID:384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:384 is located at position 5176 relative to the genome of Cryphonectria hypovirus 1.

[5528] VGAM398 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5529] An enzyme complex designated DICER COMPLEX, dices the VGAM398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM398 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM398 RNA is designated SEQ ID:3109, and is provided hereinbelow with reference to the sequence listing part.

[5530] VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5531] VGAM398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM398 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM398 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5532] The complementary binding of VGAM398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM398 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5533] It is appreciated that VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM398 host target genes. The mRNA of

each one of this plurality of VGAM398 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM398 RNA, herein designated VGAM RNA, and which when bound by VGAM398 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM398 host target proteins.

[5534] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM398 gene, herein designated VGAM GENE, on one or more VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[5535] It is yet further appreciated that a function of VGAM398 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM398 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM398 correlate with, and may be deduced from, the identity of the host target genes which VGAM398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5536] Nucleotide sequences of the VGAM398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM398 are further described hereinbelow with reference to Table 1.

[5537] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM398 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[5538] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 399 (VGAM399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5539] VGAM399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM399 was detected is described hereinabove with reference to Figs. 2–8.

[5540] VGAM399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5541] VGAM399 gene, herein designated VGAM GENE, encodes a VGAM399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM399 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM399 precursor RNA is designated SEQ ID:385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:385 is located at position 2559 relative to the genome of Cryphonectria hypovirus 1.

[5542] VGAM399 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5543] An enzyme complex designated DICER COMPLEX, dices the VGAM399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM399 RNA is designated SEQ ID:3110, and is provided hereinbelow with reference to the sequence listing part.

[5544] VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5545] VGAM399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5546] The complementary binding of VGAM399 RNA, herein designated VGAM RNA, to host target binding sites on VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5547] It is appreciated that VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM399 host target genes. The mRNA of each one of this plurality of VGAM399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM399 RNA, herein designated VGAM RNA, and which when bound by VGAM399 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM399 host target proteins.

[5548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM399 gene, herein designated VGAM GENE, on one or more VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[5549] It is yet further appreciated that a function of VGAM399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM399 correlate with, and may be deduced from, the identity of the host target genes which VGAM399 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5550] Nucleotide sequences of the VGAM399 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM399 are further described hereinbelow with reference to Table 1.

[5551] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5552] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 400 (VGAM400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5553] VGAM400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM400 was detected is described hereinabove with reference to Figs. 2–8.

[5554] VGAM400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5555] VGAM400 gene, herein designated VGAM GENE, encodes a VGAM400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM400 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM400 precursor RNA is designated SEQ ID:386, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:386 is located at position 4214 relative to the genome of Cryphonectria hypovirus 1.

[5556] VGAM400 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5557] An enzyme complex designated DICER COMPLEX, dices the VGAM400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM400 RNA is designated SEQ ID:3111, and is provided hereinbelow with reference to the sequence listing part.

[5558] VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5559] VGAM400 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM400 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5560] The complementary binding of VGAM400 RNA, herein designated VGAM RNA, to host target binding sites on VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5561] It is appreciated that VGAM400 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM400 host target genes. The mRNA of each one of this plurality of VGAM400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM400 RNA, herein designated VGAM RNA, and which when bound by VGAM400 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM400 host target proteins.

[5562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM400 gene, herein designated VGAM GENE, on one or more VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5563] It is yet further appreciated that a function of VGAM400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM400 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM400 correlate with, and may be deduced from, the identity of the host target genes which VGAM400 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5564] Nucleotide sequences of the VGAM400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM400 are further described hereinbelow with reference to Table 1.

[5565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5566] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 401 (VGAM401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5567] VGAM401 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM401 was detected is described hereinabove with reference to Figs. 2–8.

[5568] VGAM401 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5569] VGAM401 gene, herein designated VGAM GENE, encodes a VGAM401 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM401 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM401 precursor RNA is designated SEQ ID:387, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:387 is located at position 11685 relative to the genome of Cryphonectria hypovirus 1.

[5570] VGAM401 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5571] An enzyme complex designated DICER COMPLEX, dices the VGAM401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM401 RNA is designated SEQ ID:3112, and is provided hereinbelow with reference to the sequence listing part.

[5572] VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5573] VGAM401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5574] The complementary binding of VGAM401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM401 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5575] It is appreciated that VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM401 host target genes. The mRNA of each one of this plurality of VGAM401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM401 RNA, herein designated VGAM RNA, and which when bound by VGAM401 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM401 host target proteins.

[5576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM401 gene, herein designated VGAM GENE, on one or more VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5577] It is yet further appreciated that a function of VGAM401 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM401 correlate with, and may be deduced from, the identity of the host target genes which VGAM401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5578] Nucleotide sequences of the VGAM401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM401 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM401 are further described hereinbelow with reference to Table 1.

[5579] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5580] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 402 (VGAM402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5581] VGAM402 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM402 was detected is described hereinabove with reference to Figs. 2–8.

[5582] VGAM402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5583] VGAM402 gene, herein designated VGAM GENE, encodes a VGAM402 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM402 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM402 precursor RNA is designated SEQ ID:388, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:388 is located at position 6807 relative to the genome of Cryphonectria hypovirus 1.

[5584] VGAM402 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5585] An enzyme complex designated DICER COMPLEX, dices the VGAM402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM402 RNA is designated SEQ ID:3113, and is provided hereinbelow with reference to the sequence listing part.

[5586] VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5587] VGAM402 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5588] The complementary binding of VGAM402 RNA, herein designated VGAM RNA, to host target binding sites on VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[5589] It is appreciated that VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM402 host target genes. The mRNA of each one of this plurality of VGAM402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM402 RNA, herein designated VGAM RNA, and which when bound by VGAM402 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM402 host target proteins.

[5590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM402 gene, herein designated VGAM GENE, on one or more VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5591] It is yet further appreciated that a function of VGAM402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM402 correlate with, and may be deduced from, the identity of the host target genes which VGAM402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5592] Nucleotide sequences of the VGAM402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM402 are further described hereinbelow with reference to Table 1.

[5593] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5594] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 403 (VGAM403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5595] VGAM403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM403 was detected is described hereinabove with reference to Figs. 2-8.

[5596] VGAM403 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5597] VGAM403 gene, herein designated VGAM GENE, encodes a VGAM403 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM403 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM403 precursor RNA is designated SEQ ID:389, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:389 is located at position 9304 relative to the genome of Cryphonectria hypovirus 1.

[5598] VGAM403 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5599] An enzyme complex designated DICER COMPLEX, dices the VGAM403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM403 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM403 RNA is designated SEQ ID:3114, and is provided hereinbelow with reference to the sequence listing part.

[5600] VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5601] VGAM403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM403 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5602] The complementary binding of VGAM403 RNA, herein designated VGAM RNA, to host target binding sites on VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM403 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5603] It is appreciated that VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM403 host target genes. The mRNA of each one of this plurality of VGAM403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM403 RNA, herein designated VGAM RNA, and which when bound by VGAM403 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM403 host target proteins.

[5604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM403 gene, herein designated VGAM GENE, on one or more VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5605] It is yet further appreciated that a function of VGAM403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM403 correlate with, and may be deduced from, the identity of the host target genes which VGAM403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5606] Nucleotide sequences of the VGAM403 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM403 are further described hereinbelow with reference to Table 1.

[5607] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5608] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 404 (VGAM404) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5609] VGAM404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM404 was detected is described hereinabove with reference to Figs. 2-8.

[5610] VGAM404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5611] VGAM404 gene, herein designated VGAM GENE, encodes a

VGAM404 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM404 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM404 precursor RNA is designated SEQ ID:390, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:390 is located at position 7366 relative to the genome of Cryphonectria hypovirus 1.

[5612] VGAM404 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5613] An enzyme complex designated DICER COMPLEX, dices the VGAM404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM404 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM404 RNA is designated SEQ ID:3115, and is provided hereinbelow with reference to the sequence listing part.

[5614] VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5615] VGAM404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM404 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM404 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5616] The complementary binding of VGAM404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5617] It is appreciated that VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM404 host target genes. The mRNA of each one of this plurality of VGAM404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM404 RNA, herein designated VGAM RNA, and which when bound by VGAM404 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM404 host target proteins.

[5618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM404 gene, herein designated VGAM GENE, on one or more VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5619] It is yet further appreciated that a function of VGAM404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM404 correlate with, and may be deduced from, the identity of the host target genes which VGAM404 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5620] Nucleotide sequences of the VGAM404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM404 are further de-

scribed hereinbelow with reference to Table 1.

[5621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5622] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 405 (VGAM405) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5623] VGAM405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM405 was detected is described hereinabove with reference to Figs. 2-8.

[5624] VGAM405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5625] VGAM405 gene, herein designated VGAM GENE, encodes a VGAM405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM405 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM405 precursor RNA is designated SEQ ID:391, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:391 is located at position 3539 relative to the genome of Cryphonectria hypovirus 1.

[5626] VGAM405 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5627] An enzyme complex designated DICER COMPLEX, dices the VGAM405 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM405 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM405 RNA is designated SEQ ID:3116, and is provided hereinbelow with reference to the sequence listing part.

[5628] VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5629] VGAM405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM405 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM405 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5630] The complementary binding of VGAM405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM405 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM405 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5631] It is appreciated that VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM405 host target genes. The mRNA of each one of this plurality of VGAM405 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM405 RNA, herein designated VGAM RNA, and which when bound by VGAM405 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM405 host target proteins.

[5632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM405 gene, herein designated VGAM GENE, on one or more VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5633] It is yet further appreciated that a function of VGAM405 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM405 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM405 correlate with, and may be deduced from, the identity of the host target genes which VGAM405 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5634] Nucleotide sequences of the VGAM405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM405 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM405 are further described hereinbelow with reference to Table 1.

[5635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5636] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 406 (VGAM406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5637] VGAM406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM406 was detected is described hereinabove with reference to Figs. 2-8.

[5638] VGAM406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria hypovirus 1. VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[5639] VGAM406 gene, herein designated VGAM GENE, encodes a VGAM406 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM406 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM406 precursor RNA is designated SEQ ID:392, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:392 is located at position 3878 relative to the genome of Cryphonectria hypovirus 1.

[5640] VGAM406 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5641] An enzyme complex designated DICER COMPLEX, dices

the VGAM406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM406 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM406 RNA is designated SEQ ID:3117, and is provided hereinbelow with reference to the sequence listing part.

[5642] VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5643] VGAM406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM406 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5644] The complementary binding of VGAM406 RNA, herein designated VGAM RNA, to host target binding sites on VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5645] It is appreciated that VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM406 host target genes. The mRNA of each one of this plurality of VGAM406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM406 RNA, herein designated VGAM RNA, and which when bound by VGAM406 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM406 host target proteins.

[5646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM406 gene, herein designated VGAM GENE, on one or more VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5647] It is yet further appreciated that a function of VGAM406 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of viral infection by Cryphonectria hypovirus 1. Specific functions, and accordingly utilities, of VGAM406 correlate with, and may be deduced from, the identity of the host target genes which VGAM406 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5648] Nucleotide sequences of the VGAM406 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM406 are further described hereinbelow with reference to Table 1.

[5649] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5650] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 407 (VGAM407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5651] VGAM407 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM407 was detected is described hereinabove with reference to Figs. 2-8.

[5652] VGAM407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melon necrotic spot virus. VGAM407 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5653] VGAM407 gene, herein designated VGAM GENE, encodes a VGAM407 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM407 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM407 precursor RNA is designated SEQ ID:393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:393 is located at position 1162 relative to the genome of Melon necrotic spot virus.

[5654] VGAM407 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5655] An enzyme complex designated DICER COMPLEX, dices the VGAM407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM407 RNA is designated SEQ ID:3118, and is provided hereinbelow with reference to the sequence listing part.

[5656] VGAM407 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5657] VGAM407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM407 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5658] The complementary binding of VGAM407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM407 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5659] It is appreciated that VGAM407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM407 host target genes. The mRNA of each one of this plurality of VGAM407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM407 RNA, herein designated VGAM RNA, and which when bound by VGAM407 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM407 host target proteins.

[5660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM407 gene, herein designated VGAM GENE, on one or more VGAM407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5661] It is yet further appreciated that a function of VGAM407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of viral infection by Melon necrotic spot virus. Specific functions, and accordingly utilities, of VGAM407 correlate with, and may be deduced from, the identity of the host target genes which VGAM407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5662] Nucleotide sequences of the VGAM407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM407 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM407 are further described hereinbelow with reference to Table 1.

[5663] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM407 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5664] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 408 (VGAM408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5665] VGAM408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM408 was detected is described hereinabove with reference to Figs. 2-8.

[5666] VGAM408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melon necrotic spot

virus. VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5667] VGAM408 gene, herein designated VGAM GENE, encodes a VGAM408 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM408 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM408 precursor RNA is designated SEQ ID:394, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:394 is located at position 266 relative to the genome of Melon necrotic spot virus.

[5668] VGAM408 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[5669] An enzyme complex designated DICER COMPLEX, dices the VGAM408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM408 RNA is designated SEQ ID:3119, and is provided hereinbelow with reference to the sequence listing part.

[5670] VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5671] VGAM408 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM408 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5672] The complementary binding of VGAM408 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5673] It is appreciated that VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM408 host target genes. The mRNA of each one of this plurality of VGAM408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM408 RNA, herein designated VGAM RNA, and which when bound by VGAM408 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM408 host target proteins.

[5674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM408 gene, herein designated VGAM GENE, on one or more VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5675] It is yet further appreciated that a function of VGAM408 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM408 include diagnosis, prevention and treatment of viral infection by Melon necrotic spot virus. Specific functions, and accordingly utilities, of VGAM408 correlate with, and may be deduced from, the identity of the host target genes which VGAM408 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5676] Nucleotide sequences of the VGAM408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM408 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM408 are further described hereinbelow with reference to Table 1.

[5677] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5678] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 409 (VGAM409) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5679] VGAM409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM409 was detected is described hereinabove with reference to Figs. 2-8.

[5680] VGAM409 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Melon necrotic spot virus. VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5681] VGAM409 gene, herein designated VGAM GENE, encodes a VGAM409 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM409 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM409 precursor RNA is designated SEQ ID:395, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:395 is located at position 894 relative to the genome of Melon necrotic spot virus.

[5682] VGAM409 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5683] An enzyme complex designated DICER COMPLEX, dices the VGAM409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM409 RNA is designated SEQ ID:3120, and is provided hereinbelow with reference to the sequence listing part.

[5684] VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5685] VGAM409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5686] The complementary binding of VGAM409 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5687] It is appreciated that VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM409 host target genes. The mRNA of each one of this plurality of VGAM409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM409 RNA, herein designated VGAM RNA, and which when bound by VGAM409 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM409 host target proteins.

[5688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM409 gene, herein designated VGAM GENE, on one or more VGAM409 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5689] It is yet further appreciated that a function of VGAM409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of viral infection by Melon necrotic spot virus. Specific functions, and accordingly utilities, of VGAM409 correlate with, and may be deduced from, the identity of the host target genes which VGAM409 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5690] Nucleotide sequences of the VGAM409 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM409 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM409 are further described hereinbelow with reference to Table 1.

[5691] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM409 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5692] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 410 (VGAM410) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5693] VGAM410 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM410 was detected is described hereinabove with reference to Figs. 2-8.

[5694] VGAM410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of O'nyong-nyong virus. VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5695] VGAM410 gene, herein designated VGAM GENE, encodes a VGAM410 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM410 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM410 precursor RNA is designated SEQ ID:396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:396 is located at position 5873 relative to the genome of O'nyong-nyong virus.

[5696] VGAM410 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5697] An enzyme complex designated DICER COMPLEX, dices the VGAM410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM410 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM410 RNA is designated SEQ ID:3121, and is provided hereinbelow with reference to the sequence listing part.

[5698] VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[5699] VGAM410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM410 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM410 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5700] The complementary binding of VGAM410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5701] It is appreciated that VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM410 host target genes. The mRNA of each one of this plurality of VGAM410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM410 RNA, herein designated VGAM RNA, and which when bound by VGAM410 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM410 host target proteins.

[5702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM410 gene, herein designated VGAM GENE, on one or

more VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5703] It is yet further appreciated that a function of VGAM410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM410 include diagnosis, prevention and treatment of viral infection by O'nyong-nyong virus. Specific functions, and accordingly utilities, of VGAM410 correlate with, and may be deduced from, the identity of the host target genes which VGAM410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5704] Nucleotide sequences of the VGAM410 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM410 are further described hereinbelow with reference to Table 1.

[5705] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM410 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5706] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 411 (VGAM411) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5707] VGAM411 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM411 was detected is described

hereinabove with reference to Figs. 2–8.

[5708] VGAM411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Igbo Ora virus.

VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5709] VGAM411 gene, herein designated VGAM GENE, encodes a VGAM411 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM411 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM411 precursor RNA is designated SEQ ID:397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:397 is located at position 3184 relative to the genome of Igbo Ora virus.

[5710] VGAM411 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5711] An enzyme complex designated DICER COMPLEX, dices the VGAM411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM411 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM411 RNA is designated SEQ ID:3122, and is provided hereinbelow with reference to the sequence listing part.

[5712] VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5713] VGAM411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM411 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM411 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[5714] The complementary binding of VGAM411 RNA, herein designated VGAM RNA, to host target binding sites on VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5715] It is appreciated that VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM411 host target genes. The mRNA of each one of this plurality of VGAM411 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM411 RNA, herein designated VGAM RNA, and which when bound by VGAM411 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM411 host target proteins.

[5716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM411 gene, herein designated VGAM GENE, on one or more VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5717] It is yet further appreciated that a function of VGAM411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM411 include diagnosis, prevention and treatment of viral infection by Igbo Ora virus. Specific functions, and accordingly utilities, of VGAM411 correlate with, and may be deduced from, the identity of the host target genes which VGAM411 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[5718] Nucleotide sequences of the VGAM411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM411 are further described hereinbelow with reference to Table 1.

[5719] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5720] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 412 (VGAM412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5721] VGAM412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM412 was detected is described hereinabove with reference to Figs. 2–8.

[5722] VGAM412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of O'nyong–nyong virus.

VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5723] VGAM412 gene, herein designated VGAM GENE, encodes a VGAM412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM412 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM412 precursor RNA is designated SEQ ID:398, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:398 is located at position 4500 relative to the genome of O'nyong–nyong virus.

[5724] VGAM412 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi–

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5725] An enzyme complex designated DICER COMPLEX, dices the VGAM412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM412 RNA is designated SEQ ID:3123, and is provided hereinbelow with reference to the sequence listing part.

[5726] VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5727] VGAM412 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM412 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5728] The complementary binding of VGAM412 RNA, herein designated VGAM RNA, to host target binding sites on VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5729] It is appreciated that VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM412 host target genes. The mRNA of each one of this plurality of VGAM412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM412 RNA, herein designated VGAM RNA, and which when bound by VGAM412 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM412 host target proteins.

[5730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM412 gene, herein designated VGAM GENE, on one or more VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5731] It is yet further appreciated that a function of VGAM412 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of viral infection by O'nyong-nyong virus. Specific functions, and accordingly utilities, of VGAM412 correlate with, and may be deduced from, the identity of the host target genes which VGAM412 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[5732] Nucleotide sequences of the VGAM412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM412 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM412 are further described hereinbelow with reference to Table 1.

[5733] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5734] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 413 (VGAM413) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5735] VGAM413 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM413 was detected is described hereinabove with reference to Figs. 2–8.

[5736] VGAM413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5737] VGAM413 gene, herein designated VGAM GENE, encodes a VGAM413 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM413 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM413 precursor RNA is designated SEQ ID:399, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:399 is located at position 7131 relative to the genome of Pepper mottle virus.

[5738] VGAM413 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5739] An enzyme complex designated DICER COMPLEX, dices the VGAM413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM413 RNA is designated SEQ ID:3124, and is provided hereinbelow with reference to the sequence listing part.

[5740] VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5741] VGAM413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM413 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5742] The complementary binding of VGAM413 RNA, herein designated VGAM RNA, to host target binding sites on VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5743] It is appreciated that VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM413 host target genes. The mRNA of each one of this plurality of VGAM413 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM413 RNA, herein designated VGAM RNA, and which when bound by VGAM413 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM413 host target proteins.

[5744] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM413 gene, herein designated VGAM GENE, on one or more VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5745] It is yet further appreciated that a function of VGAM413 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM413 correlate with, and may be deduced from, the identity of the

host target genes which VGAM413 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5746] Nucleotide sequences of the VGAM413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM413 are further described hereinbelow with reference to Table 1.

[5747] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5748] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 414 (VGAM414) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5749] VGAM414 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM414 was detected is described hereinabove with reference to Figs. 2–8.

[5750] VGAM414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5751] VGAM414 gene, herein designated VGAM GENE, encodes a VGAM414 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM414 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM414 precursor RNA is designated SEQ ID:400, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:400 is located at position 8752 relative to the genome of Pepper mottle virus.

[5752] VGAM414 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM414 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5753] An enzyme complex designated DICER COMPLEX, dices the VGAM414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM414 RNA is designated SEQ ID:3125, and is provided hereinbelow with reference to the sequence listing part.

[5754] VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM414 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5755] VGAM414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM414 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5756] The complementary binding of VGAM414 RNA, herein designated VGAM RNA, to host target binding sites on VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5757] It is appreciated that VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM414 host target genes. The mRNA of each one of this plurality of VGAM414 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM414 RNA, herein designated VGAM RNA, and which when bound by VGAM414 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM414 host target proteins.

[5758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM414 gene, herein designated VGAM GENE, on one or more VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5759] It is yet further appreciated that a function of VGAM414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM414 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5760] Nucleotide sequences of the VGAM414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM414 are further described hereinbelow with reference to Table 1.

[5761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5762] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 415 (VGAM415) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[5763] VGAM415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM415 was detected is described hereinabove with reference to Figs. 2–8.

[5764] VGAM415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5765] VGAM415 gene, herein designated VGAM GENE, encodes a VGAM415 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM415 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM415 precursor RNA is designated SEQ ID:401, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:401 is located at position 792 relative to the genome of Pepper mottle virus.

[5766] VGAM415 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM415 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5767] An enzyme complex designated DICER COMPLEX, dices the VGAM415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM415 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM415 RNA is designated SEQ ID:3126, and is provided hereinbelow with reference to the sequence listing part.

[5768] VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM415 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5769] VGAM415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM415 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5770] The complementary binding of VGAM415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5771] It is appreciated that VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM415 host target genes. The mRNA of each one of this plurality of VGAM415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM415 RNA, herein designated VGAM RNA, and which when bound by VGAM415 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM415 host target proteins.

[5772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM415 gene, herein designated VGAM GENE, on one or more VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5773] It is yet further appreciated that a function of VGAM415 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Spe-

cific functions, and accordingly utilities, of VGAM415 correlate with, and may be deduced from, the identity of the host target genes which VGAM415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5774] Nucleotide sequences of the VGAM415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM415 are further described hereinbelow with reference to Table 1.

[5775] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM415 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5776] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 416 (VGAM416) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[5777] VGAM416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM416 was detected is described hereinabove with reference to Figs. 2–8.

[5778] VGAM416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5779] VGAM416 gene, herein designated VGAM GENE, encodes a VGAM416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM416 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM416 precursor RNA is designated SEQ ID:402, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:402 is located at position 7262 relative to the genome of Pepper mottle virus.

[5780] VGAM416 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5781] An enzyme complex designated DICER COMPLEX, dices the VGAM416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM416 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM416 RNA is designated SEQ ID:3127, and is provided hereinbelow with reference to the sequence listing part.

[5782] VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5783] VGAM416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM416 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM416 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5784] The complementary binding of VGAM416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5785] It is appreciated that VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM416 host target genes. The mRNA of each one of this plurality of VGAM416 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM416 RNA, herein designated VGAM RNA, and which when bound by VGAM416 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM416 host target proteins.

[5786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM416 gene, herein designated VGAM GENE, on one or more VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5787] It is yet further appreciated that a function of VGAM416 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM416 include diagnosis, prevention and

treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM416 correlate with, and may be deduced from, the identity of the host target genes which VGAM416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5788] Nucleotide sequences of the VGAM416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM416 are further described hereinbelow with reference to Table 1.

[5789] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM416 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5790] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 417 (VGAM417) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5791] VGAM417 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM417 was detected is described hereinabove with reference to Figs. 2–8.

[5792] VGAM417 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5793] VGAM417 gene, herein designated VGAM GENE, encodes a VGAM417 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM417 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM417 precursor RNA is designated SEQ ID:403, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:403 is located at position 8444 relative to the genome of Pepper mottle virus.

[5794] VGAM417 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5795] An enzyme complex designated DICER COMPLEX, dices the VGAM417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM417 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM417 RNA is designated SEQ ID:3128, and is provided hereinbelow with reference to the sequence listing part.

[5796] VGAM417 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5797] VGAM417 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM417 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5798] The complementary binding of VGAM417 RNA, herein designated VGAM RNA, to host target binding sites on VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM417 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5799] It is appreciated that VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM417 host target genes. The mRNA of each one of this plurality of VGAM417 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM417 RNA, herein designated VGAM

RNA, and which when bound by VGAM417 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM417 host target proteins.

[5800] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM417 gene, herein designated VGAM GENE, on one or more VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5801] It is yet further appreciated that a function of VGAM417 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM417 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM417 correlate with, and may be deduced from, the identity of the host target genes which VGAM417 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5802] Nucleotide sequences of the VGAM417 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM417 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM417 are further described hereinbelow with reference to Table 1.

[5803] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM417 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5804] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 418 (VGAM418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5805] VGAM418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM418 was detected is described hereinabove with reference to Figs. 2–8.

[5806] VGAM418 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5807] VGAM418 gene, herein designated VGAM GENE, encodes a VGAM418 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM418 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM418 precursor RNA is designated SEQ ID:404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:404 is located at position 4033 relative to

the genome of Pepper mottle virus.

[5808] VGAM418 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5809] An enzyme complex designated DICER COMPLEX, dices the VGAM418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM418 RNA is designated SEQ ID:3129, and is provided hereinbelow with reference to the sequence listing part.

[5810] VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5811] VGAM418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM418 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM418 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5812] The complementary binding of VGAM418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5813] It is appreciated that VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM418 host target genes. The mRNA of each one of this plurality of VGAM418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM418 RNA, herein designated VGAM RNA, and which when bound by VGAM418 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM418 host target proteins.

[5814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM418 gene, herein designated VGAM GENE, on one or more VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5815] It is yet further appreciated that a function of VGAM418 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM418 correlate with, and may be deduced from, the identity of the host target genes which VGAM418 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5816] Nucleotide sequences of the VGAM418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM418 are further described hereinbelow with reference to Table 1.

[5817] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM418 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5818] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 419 (VGAM419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5819] VGAM419 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM419 was detected is described hereinabove with reference to Figs. 2–8.

[5820] VGAM419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5821] VGAM419 gene, herein designated VGAM GENE, encodes a VGAM419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM419 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM419 precursor RNA is designated SEQ ID:405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:405 is located at position 6952 relative to the genome of Pepper mottle virus.

[5822] VGAM419 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5823] An enzyme complex designated DICER COMPLEX, dices the VGAM419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM419 RNA is designated SEQ ID:3130, and is provided hereinbelow with reference to the sequence

listing part.

[5824] VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5825] VGAM419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5826] The complementary binding of VGAM419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5827] It is appreciated that VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM419 host target genes. The mRNA of each one of this plurality of VGAM419 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM419 RNA, herein designated VGAM RNA, and which when bound by VGAM419 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM419 host target proteins.

[5828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM419 gene, herein designated VGAM GENE, on one or more VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5829] It is yet further appreciated that a function of VGAM419 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM419 correlate with, and may be deduced from, the identity of the host target genes which VGAM419 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5830] Nucleotide sequences of the VGAM419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM419 are further described hereinbelow with reference to Table 1.

[5831] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5832] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 420 (VGAM420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5833] VGAM420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM420 was detected is described hereinabove with reference to Figs. 2–8.

[5834] VGAM420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 39. VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5835] VGAM420 gene, herein designated VGAM GENE, encodes a VGAM420 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM420 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM420 precursor RNA is designated SEQ ID:406, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:406 is located at position 5287 relative to the genome of Human papillomavirus type 39.

[5836] VGAM420 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5837] An enzyme complex designated DICER COMPLEX, dices the VGAM420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM420 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM420 RNA is designated SEQ ID:3131, and

is provided hereinbelow with reference to the sequence listing part.

[5838] VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5839] VGAM420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5840] The complementary binding of VGAM420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM420 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5841] It is appreciated that VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM420 host target genes. The mRNA of each one of this plurality of VGAM420 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM420 RNA, herein designated VGAM RNA, and which when bound by VGAM420 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM420 host target proteins.

[5842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM420 gene, herein designated VGAM GENE, on one or more VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5843] It is yet further appreciated that a function of VGAM420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 39. Specific functions, and accordingly utilities, of VGAM420 correlate with, and may be deduced from, the identity of the host target genes which VGAM420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5844] Nucleotide sequences of the VGAM420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM420 are further described hereinbelow with reference to Table 1.

[5845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5846] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 421 (VGAM421) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5847] VGAM421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM421 was detected is described hereinabove with reference to Figs. 2–8.

[5848] VGAM421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 39. VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5849] VGAM421 gene, herein designated VGAM GENE, encodes a VGAM421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM421 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM421 precursor RNA is

designated SEQ ID:407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:407 is located at position 4323 relative to the genome of Human papillomavirus type 39.

[5850] VGAM421 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5851] An enzyme complex designated DICER COMPLEX, dices the VGAM421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM421 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide se-

quence of VGAM421 RNA is designated SEQ ID:3132, and is provided hereinbelow with reference to the sequence listing part.

[5852] VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5853] VGAM421 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5854] The complementary binding of VGAM421 RNA, herein designated VGAM RNA, to host target binding sites on VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5855] It is appreciated that VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM421 host target genes. The mRNA of

each one of this plurality of VGAM421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM421 RNA, herein designated VGAM RNA, and which when bound by VGAM421 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM421 host target proteins.

[5856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM421 gene, herein designated VGAM GENE, on one or more VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[5857] It is yet further appreciated that a function of VGAM421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 39. Specific functions, and accordingly utilities, of VGAM421 correlate with, and may be deduced from, the identity of the host target genes which VGAM421 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5858] Nucleotide sequences of the VGAM421 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM421 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM421 are further described hereinbelow with reference to Table 1.

[5859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM421 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[5860] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 422 (VGAM422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5861] VGAM422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM422 was detected is described hereinabove with reference to Figs. 2–8.

[5862] VGAM422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of canine parvovirus. VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5863] VGAM422 gene, herein designated VGAM GENE, encodes a VGAM422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM422 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM422 precursor RNA is designated SEQ ID:408, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:408 is located at position 1869 relative to the genome of canine parvovirus.

[5864] VGAM422 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5865] An enzyme complex designated DICER COMPLEX, dices the VGAM422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM422 RNA is designated SEQ ID:3133, and is provided hereinbelow with reference to the sequence listing part.

[5866] VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5867] VGAM422 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM422 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5868] The complementary binding of VGAM422 RNA, herein designated VGAM RNA, to host target binding sites on VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM422 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5869] It is appreciated that VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM422 host target genes. The mRNA of each one of this plurality of VGAM422 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM422 RNA, herein designated VGAM RNA, and which when bound by VGAM422 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM422 host target proteins.

[5870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM422 gene, herein designated VGAM GENE, on one or more VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[5871] It is yet further appreciated that a function of VGAM422 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM422 include diagnosis, prevention and treatment of viral infection by canine parvovirus. Specific functions, and accordingly utilities, of VGAM422 correlate with, and may be deduced from, the identity of the host target genes which VGAM422 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[5872] Nucleotide sequences of the VGAM422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM422 are further described hereinbelow with reference to Table 1.

[5873] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM422 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5874] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 423 (VGAM423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5875] VGAM423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM423 was detected is described hereinabove with reference to Figs. 2–8.

[5876] VGAM423 gene, herein designated VGAM GENE, is a viral gene contained in the genome of canine parvovirus. VGAM423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5877] VGAM423 gene, herein designated VGAM GENE, encodes a VGAM423 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM423 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM423 precursor RNA is designated SEQ ID:409, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:409 is located at position 1298 relative to the genome of canine parvovirus.

[5878] VGAM423 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5879] An enzyme complex designated DICER COMPLEX, dices the VGAM423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM423 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM423 RNA is designated SEQ ID:3134, and is provided hereinbelow with reference to the sequence listing part.

[5880] VGAM423 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5881] VGAM423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM423 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5882] The complementary binding of VGAM423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM423 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5883] It is appreciated that VGAM423 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM423 host target genes. The mRNA of each one of this plurality of VGAM423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM423 RNA, herein designated VGAM RNA, and which when bound by VGAM423 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM423 host target proteins.

[5884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM423 gene, herein designated VGAM GENE, on one or more VGAM423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5885] It is yet further appreciated that a function of VGAM423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM423 include diagnosis, prevention and treatment of viral infection by canine parvovirus. Specific functions, and accordingly utilities, of VGAM423 correlate with, and may be deduced from, the identity of the host target genes which VGAM423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5886] Nucleotide sequences of the VGAM423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM423 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM423 are further described hereinbelow with reference to Table 1.

[5887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5888] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 424 (VGAM424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5889] VGAM424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM424 was detected is described hereinabove with reference to Figs. 2–8.

[5890] VGAM424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM424 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5891] VGAM424 gene, herein designated VGAM GENE, encodes a VGAM424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM424 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM424 precursor RNA is designated SEQ ID:410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:410 is located at position 5883 relative to the genome of Rabies virus.

[5892] VGAM424 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5893] An enzyme complex designated DICER COMPLEX, dices the VGAM424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM424 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM424 RNA is designated SEQ ID:3135, and is provided hereinbelow with reference to the sequence listing part.

[5894] VGAM424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5895] VGAM424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5896] The complementary binding of VGAM424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5897] It is appreciated that VGAM424 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM424 host target genes. The mRNA of each one of this plurality of VGAM424 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM424 RNA, herein designated VGAM RNA, and which when bound by VGAM424 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM424 host target proteins.

[5898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM424 gene, herein designated VGAM GENE, on one or more VGAM424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5899] It is yet further appreciated that a function of VGAM424 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM424 correlate with, and may be deduced from, the identity of the host target genes which VGAM424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5900] Nucleotide sequences of the VGAM424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM424 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM424 are further described hereinbelow with reference to Table 1.

[5901] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5902] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 425 (VGAM425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5903] VGAM425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM425 was detected is described hereinabove with reference to Figs. 2–8.

[5904] VGAM425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5905] VGAM425 gene, herein designated VGAM GENE, encodes a VGAM425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM425 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM425 precursor RNA is designated SEQ ID:411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:411 is located at position 8963 relative to the genome of Rabies virus.

[5906] VGAM425 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5907] An enzyme complex designated DICER COMPLEX, dices the VGAM425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM425 RNA is designated SEQ ID:3136, and is provided hereinbelow with reference to the sequence listing part.

[5908] VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5909] VGAM425 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5910] The complementary binding of VGAM425 RNA, herein designated VGAM RNA, to host target binding sites on VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5911] It is appreciated that VGAM425 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM425 host target genes. The mRNA of each one of this plurality of VGAM425 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM425 RNA, herein designated VGAM RNA, and which when bound by VGAM425 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM425 host target proteins.

[5912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM425 gene, herein designated VGAM GENE, on one or more VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5913] It is yet further appreciated that a function of VGAM425 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM425 correlate with, and may be deduced from, the identity of the host target genes which VGAM425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5914] Nucleotide sequences of the VGAM425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM425 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM425 are further described hereinbelow with reference to Table 1.

[5915] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM425 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5916] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 426 (VGAM426) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5917] VGAM426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM426 was detected is described hereinabove with reference to Figs. 2–8.

[5918] VGAM426 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5919] VGAM426 gene, herein designated VGAM GENE, encodes a VGAM426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM426 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM426 precursor RNA is designated SEQ ID:412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:412 is located at position 5774 relative to the genome of Rabies virus.

[5920] VGAM426 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5921] An enzyme complex designated DICER COMPLEX, dices the VGAM426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM426 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM426 RNA is designated SEQ ID:3137, and is provided hereinbelow with reference to the sequence listing part.

[5922] VGAM426 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5923] VGAM426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5924] The complementary binding of VGAM426 RNA, herein designated VGAM RNA, to host target binding sites on VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5925] It is appreciated that VGAM426 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM426 host target genes. The mRNA of each one of this plurality of VGAM426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM426 RNA, herein designated VGAM RNA, and which when bound by VGAM426 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM426 host target proteins.

[5926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM426 gene, herein designated VGAM GENE, on one or more VGAM426 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5927] It is yet further appreciated that a function of VGAM426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM426 correlate with, and may be deduced from, the identity of the host target genes which VGAM426 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5928] Nucleotide sequences of the VGAM426 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM426 are further described hereinbelow with reference to Table 1.

[5929] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5930] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 427 (VGAM427) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5931] VGAM427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM427 was detected is described hereinabove with reference to Figs. 2–8.

[5932] VGAM427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5933] VGAM427 gene, herein designated VGAM GENE, encodes a VGAM427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM427 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM427 precursor RNA is designated SEQ ID:413, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:413 is located at position 5539 relative to the genome of Rabies virus.

[5934] VGAM427 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5935] An enzyme complex designated DICER COMPLEX, dices the VGAM427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM427 RNA is designated SEQ ID:3138, and is provided hereinbelow with reference to the sequence listing part.

[5936] VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5937] VGAM427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5938] The complementary binding of VGAM427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5939] It is appreciated that VGAM427 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM427 host target genes. The mRNA of each one of this plurality of VGAM427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM427 RNA, herein designated VGAM RNA, and which when bound by VGAM427 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM427 host target proteins.

[5940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM427 gene, herein designated VGAM GENE, on one or more VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5941] It is yet further appreciated that a function of VGAM427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM427 correlate with, and may be deduced from, the identity of the host target genes which VGAM427 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5942] Nucleotide sequences of the VGAM427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM427 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM427 are further described hereinbelow with reference to Table 1.

[5943] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5944] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 428 (VGAM428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5945] VGAM428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM428 was detected is described hereinabove with reference to Figs. 2–8.

[5946] VGAM428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies virus. VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5947] VGAM428 gene, herein designated VGAM GENE, encodes a VGAM428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM428 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM428 precursor RNA is designated SEQ ID:414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:414 is located at position 6617 relative to the genome of Rabies virus.

[5948] VGAM428 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5949] An enzyme complex designated DICER COMPLEX, dices the VGAM428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM428 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM428 RNA is designated SEQ ID:3139, and is provided hereinbelow with reference to the sequence listing part.

[5950] VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5951] VGAM428 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5952] The complementary binding of VGAM428 RNA, herein designated VGAM RNA, to host target binding sites on VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5953] It is appreciated that VGAM428 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM428 host target genes. The mRNA of each one of this plurality of VGAM428 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM428 RNA, herein designated VGAM RNA, and which when bound by VGAM428 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM428 host target proteins.

[5954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM428 gene, herein designated VGAM GENE, on one or more VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5955] It is yet further appreciated that a function of VGAM428 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of viral infection by Rabies virus. Specific functions, and accordingly utilities, of VGAM428 correlate with, and may be deduced from, the identity of the host target genes which VGAM428 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5956] Nucleotide sequences of the VGAM428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM428 are further described hereinbelow with reference to Table 1.

[5957] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM428 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5958] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 429 (VGAM429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5959] VGAM429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM429 was detected is described hereinabove with reference to Figs. 2–8.

[5960] VGAM429 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit hemorrhagic disease virus. VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5961] VGAM429 gene, herein designated VGAM GENE, encodes a VGAM429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM429 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM429 precursor RNA is designated SEQ ID:415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:415 is located at position 4010 relative to the genome of Rabbit hemorrhagic disease virus.

[5962] VGAM429 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5963] An enzyme complex designated DICER COMPLEX, dices the VGAM429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM429 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM429 RNA is designated SEQ ID:3140, and is provided hereinbelow with reference to the sequence listing part.

[5964] VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5965] VGAM429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5966] The complementary binding of VGAM429 RNA, herein designated VGAM RNA, to host target binding sites on VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM429 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5967] It is appreciated that VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM429 host target genes. The mRNA of each one of this plurality of VGAM429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM429 RNA, herein designated VGAM RNA, and which when bound by VGAM429 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM429 host target proteins.

[5968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM429 gene, herein designated VGAM GENE, on one or more VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5969] It is yet further appreciated that a function of VGAM429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of viral infection by Rabbit hemorrhagic disease virus. Specific functions, and accordingly utilities, of VGAM429 correlate with, and may be deduced from, the identity of the host target genes which VGAM429 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5970] Nucleotide sequences of the VGAM429 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM429 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM429 are further described hereinbelow with reference to Table 1.

[5971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM429 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5972] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 430 (VGAM430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5973] VGAM430 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM430 was detected is described hereinabove with reference to Figs. 2–8.

[5974] VGAM430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit hemorrhagic disease virus. VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5975] VGAM430 gene, herein designated VGAM GENE, encodes a VGAM430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM430 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM430 precursor RNA is designated SEQ ID:416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:416 is located at position 6133 relative to the genome of Rabbit hemorrhagic disease virus.

[5976] VGAM430 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5977] An enzyme complex designated DICER COMPLEX, dices the VGAM430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM430 RNA is designated SEQ ID:3141, and is provided hereinbelow with reference to the sequence listing part.

[5978] VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5979] VGAM430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5980] The complementary binding of VGAM430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[5981] It is appreciated that VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM430 host target genes. The mRNA of each one of this plurality of VGAM430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM430 RNA, herein designated VGAM RNA, and which when bound by VGAM430 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM430 host target proteins.

[5982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM430 gene, herein designated VGAM GENE, on one or more VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5983] It is yet further appreciated that a function of VGAM430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of viral infection by Rabbit hemorrhagic disease virus. Specific functions, and accordingly utilities, of VGAM430 correlate with, and may be deduced from, the identity of the host target genes which VGAM430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5984] Nucleotide sequences of the VGAM430 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM430 are further described hereinbelow with reference to Table 1.

[5985] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[5986] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 431 (VGAM431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[5987] VGAM431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM431 was detected is described hereinabove with reference to Figs. 2-8.

[5988] VGAM431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit hemorrhagic disease virus. VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[5989] VGAM431 gene, herein designated VGAM GENE, encodes a VGAM431 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM431 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM431 precursor RNA is designated SEQ ID:417, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:417 is located at position 3819 relative to the genome of Rabbit hemorrhagic disease virus.

[5990] VGAM431 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5991] An enzyme complex designated DICER COMPLEX, dices the VGAM431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM431 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM431 RNA is designated SEQ ID:3142, and is provided hereinbelow with reference to the sequence listing part.

[5992] VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5993] VGAM431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM431 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM431 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5994] The complementary binding of VGAM431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM431 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[5995] It is appreciated that VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM431 host target genes. The mRNA of each one of this plurality of VGAM431 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM431 RNA, herein designated VGAM RNA, and which when bound by VGAM431 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM431 host target proteins.

[5996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM431 gene, herein designated VGAM GENE, on one or more VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5997] It is yet further appreciated that a function of VGAM431 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM431 include diagnosis, prevention and treatment of viral infection by Rabbit hemorrhagic disease virus. Specific functions, and accordingly utilities, of VGAM431 correlate with, and may be deduced from, the identity of the host target genes which VGAM431 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[5998] Nucleotide sequences of the VGAM431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM431 are further described hereinbelow with reference to Table 1.

[5999] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6000] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 432 (VGAM432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6001] VGAM432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM432 was detected is described hereinabove with reference to Figs. 2-8.

[6002] VGAM432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit hemorrhagic disease virus. VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6003] VGAM432 gene, herein designated VGAM GENE, encodes a

VGAM432 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM432 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM432 precursor RNA is designated SEQ ID:418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:418 is located at position 3603 relative to the genome of Rabbit hemorrhagic disease virus.

[6004] VGAM432 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6005] An enzyme complex designated DICER COMPLEX, dices the VGAM432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM432 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM432 RNA is designated SEQ ID:3143, and is provided hereinbelow with reference to the sequence listing part.

[6006] VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6007] VGAM432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM432 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6008] The complementary binding of VGAM432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM432 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6009] It is appreciated that VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM432 host target genes. The mRNA of each one of this plurality of VGAM432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM432 RNA, herein designated VGAM RNA, and which when bound by VGAM432 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM432 host target proteins.

[6010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM432 gene, herein designated VGAM GENE, on one or more VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6011] It is yet further appreciated that a function of VGAM432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of viral infection by Rabbit hemorrhagic disease virus. Specific functions, and accordingly utilities, of VGAM432 correlate with, and may be deduced from, the identity of the host target genes which VGAM432 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6012] Nucleotide sequences of the VGAM432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM432 are further de-

scribed hereinbelow with reference to Table 1.

[6013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6014] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 433 (VGAM433) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6015] VGAM433 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM433 was detected is described hereinabove with reference to Figs. 2-8.

[6016] VGAM433 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit hemorrhagic disease virus. VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6017] VGAM433 gene, herein designated VGAM GENE, encodes a VGAM433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM433 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM433 precursor RNA is designated SEQ ID:419, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:419 is located at position 1022 relative to the genome of Rabbit hemorrhagic disease virus.

[6018] VGAM433 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6019] An enzyme complex designated DICER COMPLEX, dices the VGAM433 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM433 RNA is designated SEQ ID:3144, and is provided hereinbelow with reference to the sequence listing part.

[6020] VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6021] VGAM433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6022] The complementary binding of VGAM433 RNA, herein designated VGAM RNA, to host target binding sites on VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM433 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6023] It is appreciated that VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM433 host target genes. The mRNA of each one of this plurality of VGAM433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM433 RNA, herein designated VGAM RNA, and which when bound by VGAM433 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM433 host target proteins.

[6024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM433 gene, herein designated VGAM GENE, on one or more VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6025] It is yet further appreciated that a function of VGAM433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of viral infection by Rabbit hemorrhagic disease virus. Specific functions, and accordingly utilities, of VGAM433 correlate with, and may be deduced from, the identity of the host target genes which VGAM433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6026] Nucleotide sequences of the VGAM433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM433 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM433 are further described hereinbelow with reference to Table 1.

[6027] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM433 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6028] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 434 (VGAM434) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6029] VGAM434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM434 was detected is described hereinabove with reference to Figs. 2-8.

[6030] VGAM434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6031] VGAM434 gene, herein designated VGAM GENE, encodes a VGAM434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM434 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM434 precursor RNA is designated SEQ ID:420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:420 is located at position 14005 relative to the genome of Sendai virus.

[6032] VGAM434 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6033] An enzyme complex designated DICER COMPLEX, dices the VGAM434 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM434 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM434 RNA is designated SEQ ID:3145, and is provided hereinbelow with reference to the sequence listing part.

[6034] VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6035] VGAM434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM434 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM434 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6036] The complementary binding of VGAM434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM434 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6037] It is appreciated that VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM434 host target genes. The mRNA of each one of this plurality of VGAM434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM434 RNA, herein designated VGAM RNA, and which when bound by VGAM434 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM434 host target proteins.

[6038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM434 gene, herein designated VGAM GENE, on one or more VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6039] It is yet further appreciated that a function of VGAM434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM434 correlate with, and may be deduced from, the identity of the host target genes which VGAM434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6040] Nucleotide sequences of the VGAM434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM434 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM434 are further described hereinbelow with reference to Table 1.

[6041] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM434 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6042] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 435 (VGAM435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6043] VGAM435 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM435 was detected is described hereinabove with reference to Figs. 2-8.

[6044] VGAM435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6045] VGAM435 gene, herein designated VGAM GENE, encodes a VGAM435 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM435 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM435 precursor RNA is designated SEQ ID:421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:421 is located at position 11483 relative to the genome of Sendai virus.

[6046] VGAM435 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6047] An enzyme complex designated DICER COMPLEX, dices the VGAM435 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM435 RNA is designated SEQ ID:3146, and is provided hereinbelow with reference to the sequence listing part.

[6048] VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6049] VGAM435 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM435 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6050] The complementary binding of VGAM435 RNA, herein designated VGAM RNA, to host target binding sites on VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM435 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6051] It is appreciated that VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM435 host target genes. The mRNA of each one of this plurality of VGAM435 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM435 RNA, herein designated VGAM RNA, and which when bound by VGAM435 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM435 host target proteins.

[6052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM435 gene, herein designated VGAM GENE, on one or more VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6053] It is yet further appreciated that a function of VGAM435 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM435 correlate with, and may be deduced from, the identity of the host target genes which VGAM435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6054] Nucleotide sequences of the VGAM435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM435 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM435 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM435 are further described hereinbelow with reference to Table 1.

[6055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6056] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 436 (VGAM436) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6057] VGAM436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM436 was detected is described hereinabove with reference to Figs. 2-8.

[6058] VGAM436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6059] VGAM436 gene, herein designated VGAM GENE, encodes a VGAM436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM436 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM436 precursor RNA is designated SEQ ID:422, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:422 is located at position 14126 relative to the genome of Sendai virus.

[6060] VGAM436 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6061] An enzyme complex designated DICER COMPLEX, dices the VGAM436 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM436 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM436 RNA is designated SEQ ID:3147, and is provided hereinbelow with reference to the sequence listing part.

[6062] VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6063] VGAM436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6064] The complementary binding of VGAM436 RNA, herein designated VGAM RNA, to host target binding sites on VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM436 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6065] It is appreciated that VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM436 host target genes. The mRNA of each one of this plurality of VGAM436 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM436 RNA, herein designated VGAM RNA, and which when bound by VGAM436 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM436 host target proteins.

[6066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM436 gene, herein designated VGAM GENE, on one or more VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6067] It is yet further appreciated that a function of VGAM436 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM436 correlate with, and may be deduced from, the identity of the host target genes which VGAM436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6068] Nucleotide sequences of the VGAM436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM436 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM436 are further described hereinbelow with reference to Table 1.

[6069] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6070] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 437 (VGAM437) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6071] VGAM437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM437 was detected is described hereinabove with reference to Figs. 2-8.

[6072] VGAM437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato bushy stunt virus. VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[6073] VGAM437 gene, herein designated VGAM GENE, encodes a VGAM437 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM437 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM437 precursor RNA is designated SEQ ID:423, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:423 is located at position 3049 relative to the genome of Tomato bushy stunt virus.

[6074] VGAM437 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6075] An enzyme complex designated DICER COMPLEX, dices

the VGAM437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM437 RNA is designated SEQ ID:3148, and is provided hereinbelow with reference to the sequence listing part.

[6076] VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6077] VGAM437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM437 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM437 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM437 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6078] The complementary binding of VGAM437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM437 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6079] It is appreciated that VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM437 host target genes. The mRNA of each one of this plurality of VGAM437 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM437 RNA, herein designated VGAM RNA, and which when bound by VGAM437 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM437 host target proteins.

[6080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM437 gene, herein designated VGAM GENE, on one or more VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6081] It is yet further appreciated that a function of VGAM437 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment of viral infection by Tomato bushy stunt virus. Specific functions, and accordingly utilities, of VGAM437 correlate with, and may be deduced from, the identity of the host target genes which VGAM437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6082] Nucleotide sequences of the VGAM437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM437 are further described hereinbelow with reference to Table 1.

[6083] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6084] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 438 (VGAM438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6085] VGAM438 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM438 was detected is described hereinabove with reference to Figs. 2-8.

[6086] VGAM438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato bushy stunt virus. VGAM438 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6087] VGAM438 gene, herein designated VGAM GENE, encodes a VGAM438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM438 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM438 precursor RNA is designated SEQ ID:424, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:424 is located at position 3276 relative to the genome of Tomato bushy stunt virus.

[6088] VGAM438 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6089] An enzyme complex designated DICER COMPLEX, dices the VGAM438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM438 RNA is designated SEQ ID:3149, and is provided hereinbelow with reference to the sequence listing part.

[6090] VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6091] VGAM438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM438 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM438 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6092] The complementary binding of VGAM438 RNA, herein designated VGAM RNA, to host target binding sites on VGAM438 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM438 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6093] It is appreciated that VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM438 host target genes. The mRNA of each one of this plurality of VGAM438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM438 RNA, herein designated VGAM RNA, and which when bound by VGAM438 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM438 host target proteins.

[6094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM438 gene, herein designated VGAM GENE, on one or more VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6095] It is yet further appreciated that a function of VGAM438 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of viral infection by Tomato bushy stunt virus. Specific functions, and accordingly utilities, of VGAM438 correlate with, and may be deduced from, the identity of the host target genes which VGAM438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6096] Nucleotide sequences of the VGAM438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM438 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM438 are further described hereinbelow with reference to Table 1.

[6097] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6098] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 439 (VGAM439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6099] VGAM439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM439 was detected is described hereinabove with reference to Figs. 2-8.

[6100] VGAM439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato bushy stunt

virus. VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6101] VGAM439 gene, herein designated VGAM GENE, encodes a VGAM439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM439 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM439 precursor RNA is designated SEQ ID:425, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:425 is located at position 2898 relative to the genome of Tomato bushy stunt virus.

[6102] VGAM439 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[6103] An enzyme complex designated DICER COMPLEX, dices the VGAM439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM439 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM439 RNA is designated SEQ ID:3150, and is provided hereinbelow with reference to the sequence listing part.

[6104] VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6105] VGAM439 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6106] The complementary binding of VGAM439 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6107] It is appreciated that VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM439 host target genes. The mRNA of each one of this plurality of VGAM439 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM439 RNA, herein designated VGAM RNA, and which when bound by VGAM439 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM439 host target proteins.

[6108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM439 gene, herein designated VGAM GENE, on one or more VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6109] It is yet further appreciated that a function of VGAM439 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of viral infection by Tomato bushy stunt virus. Specific functions, and accordingly utilities, of VGAM439 correlate with, and may be deduced from, the identity of the host target genes which VGAM439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6110] Nucleotide sequences of the VGAM439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM439 are further described hereinbelow with reference to Table 1.

[6111] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6112] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 440 (VGAM440) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6113] VGAM440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM440 was detected is described hereinabove with reference to Figs. 2-8.

[6114] VGAM440 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia virus. VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6115] VGAM440 gene, herein designated VGAM GENE, encodes a VGAM440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM440 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM440 precursor RNA is designated SEQ ID:426, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:426 is located at position 22113 relative to the genome of Vaccinia virus.

[6116] VGAM440 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[6117] An enzyme complex designated DICER COMPLEX, dices the VGAM440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM440 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM440 RNA is designated SEQ ID:3151, and is provided hereinbelow with reference to the sequence listing part.

[6118] VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6119] VGAM440 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6120] The complementary binding of VGAM440 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM440 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6121] It is appreciated that VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM440 host target genes. The mRNA of each one of this plurality of VGAM440 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM440 RNA, herein designated VGAM RNA, and which when bound by VGAM440 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM440 host target proteins.

[6122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM440 gene, herein designated VGAM GENE, on one or more VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6123] It is yet further appreciated that a function of VGAM440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM440 correlate with, and may be deduced from, the identity of the host target genes which VGAM440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6124] Nucleotide sequences of the VGAM440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM440 are further described hereinbelow with reference to Table 1.

[6125] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6126] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 441 (VGAM441) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6127] VGAM441 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM441 was detected is described hereinabove with reference to Figs. 2-8.

[6128] VGAM441 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia virus. VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6129] VGAM441 gene, herein designated VGAM GENE, encodes a VGAM441 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM441 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM441 precursor RNA is designated SEQ ID:427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:427 is located at position 78448 relative to the genome of Vaccinia virus.

[6130] VGAM441 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[6131] An enzyme complex designated DICER COMPLEX, dices the VGAM441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM441 RNA is designated SEQ ID:3152, and is provided hereinbelow with reference to the sequence listing part.

[6132] VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6133] VGAM441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6134] The complementary binding of VGAM441 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6135] It is appreciated that VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM441 host target genes. The mRNA of each one of this plurality of VGAM441 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM441 RNA, herein designated VGAM RNA, and which when bound by VGAM441 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM441 host target proteins.

[6136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM441 gene, herein designated VGAM GENE, on one or more VGAM441 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6137] It is yet further appreciated that a function of VGAM441 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM441 correlate with, and may be deduced from, the identity of the host target genes which VGAM441 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6138] Nucleotide sequences of the VGAM441 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM441 are further described hereinbelow with reference to Table 1.

[6139] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM441 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6140] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 442 (VGAM442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6141] VGAM442 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM442 was detected is described hereinabove with reference to Figs. 2-8.

[6142] VGAM442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6143] VGAM442 gene, herein designated VGAM GENE, encodes a VGAM442 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM442 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM442 precursor RNA is designated SEQ ID:428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:428 is located at position 78761 relative to the genome of Vaccinia virus.

[6144] VGAM442 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6145] An enzyme complex designated DICER COMPLEX, dices the VGAM442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM442 RNA is designated SEQ ID:3153, and is provided hereinbelow with reference to the sequence listing part.

[6146] VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6147] VGAM442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM442 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM442 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6148] The complementary binding of VGAM442 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6149] It is appreciated that VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM442 host target genes. The mRNA of each one of this plurality of VGAM442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM442 RNA, herein designated VGAM RNA, and which when bound by VGAM442 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM442 host target proteins.

[6150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM442 gene, herein designated VGAM GENE, on one or more VGAM442 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6151] It is yet further appreciated that a function of VGAM442 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM442 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM442 correlate with, and may be deduced from, the identity of the host target genes which VGAM442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6152] Nucleotide sequences of the VGAM442 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM442 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM442 are further described hereinbelow with reference to Table 1.

[6153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6154] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 443 (VGAM443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6155] VGAM443 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM443 was detected is described hereinabove with reference to Figs. 2-8.

[6156] VGAM443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6157] VGAM443 gene, herein designated VGAM GENE, encodes a VGAM443 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM443 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM443 precursor RNA is designated SEQ ID:429, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:429 is located at position 81960 relative to the genome of Vaccinia virus.

[6158] VGAM443 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6159] An enzyme complex designated DICER COMPLEX, dices the VGAM443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM443 RNA is designated SEQ ID:3154, and is provided hereinbelow with reference to the sequence listing part.

[6160] VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6161] VGAM443 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6162] The complementary binding of VGAM443 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6163] It is appreciated that VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM443 host target genes. The mRNA of each one of this plurality of VGAM443 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM443 RNA, herein designated VGAM RNA, and which when bound by VGAM443 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM443 host target proteins.

[6164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM443 gene, herein designated VGAM GENE, on one or more VGAM443 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6165] It is yet further appreciated that a function of VGAM443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM443 correlate with, and may be deduced from, the identity of the host target genes which VGAM443 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6166] Nucleotide sequences of the VGAM443 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM443 are further described hereinbelow with reference to Table 1.

[6167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM443 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6168] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 444 (VGAM444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6169] VGAM444 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM444 was detected is described hereinabove with reference to Figs. 2-8.

[6170] VGAM444 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6171] VGAM444 gene, herein designated VGAM GENE, encodes a VGAM444 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM444 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM444 precursor RNA is designated SEQ ID:430, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:430 is located at position 81204 relative to the genome of Vaccinia virus.

[6172] VGAM444 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6173] An enzyme complex designated DICER COMPLEX, dices the VGAM444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM444 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM444 RNA is designated SEQ ID:3155, and is provided hereinbelow with reference to the sequence listing part.

[6174] VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6175] VGAM444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6176] The complementary binding of VGAM444 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM444 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6177] It is appreciated that VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM444 host target genes. The mRNA of each one of this plurality of VGAM444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM444 RNA, herein designated VGAM RNA, and which when bound by VGAM444 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM444 host target proteins.

[6178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM444 gene, herein designated VGAM GENE, on one or more VGAM444 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6179] It is yet further appreciated that a function of VGAM444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM444 correlate with, and may be deduced from, the identity of the host target genes which VGAM444 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6180] Nucleotide sequences of the VGAM444 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM444 are further described hereinbelow with reference to Table 1.

[6181] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6182] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 445 (VGAM445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6183] VGAM445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM445 was detected is described hereinabove with reference to Figs. 2-8.

[6184] VGAM445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 17. VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6185] VGAM445 gene, herein designated VGAM GENE, encodes a VGAM445 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM445 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM445 precursor RNA is designated SEQ ID:431, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:431 is located at position 358 relative to the genome of Human papillomavirus type 17.

[6186] VGAM445 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6187] An enzyme complex designated DICER COMPLEX, dices the VGAM445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM445 RNA is designated SEQ ID:3156, and is provided hereinbelow with reference to the sequence listing part.

[6188] VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[6189] VGAM445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6190] The complementary binding of VGAM445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM445 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6191] It is appreciated that VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM445 host target genes. The mRNA of each one of this plurality of VGAM445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM445 RNA, herein designated VGAM RNA, and which when bound by VGAM445 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM445 host target proteins.

[6192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM445 gene, herein designated VGAM GENE, on one or

more VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6193] It is yet further appreciated that a function of VGAM445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 17. Specific functions, and accordingly utilities, of VGAM445 correlate with, and may be deduced from, the identity of the host target genes which VGAM445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6194] Nucleotide sequences of the VGAM445 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM445 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM445 are further described hereinbelow with reference to Table 1.

[6195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM445 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6196] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 446 (VGAM446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6197] VGAM446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM446 was detected is described

hereinabove with reference to Figs. 2–8.

[6198] VGAM446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 17. VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6199] VGAM446 gene, herein designated VGAM GENE, encodes a VGAM446 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM446 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM446 precursor RNA is designated SEQ ID:432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:432 is located at position 437 relative to the genome of Human papillomavirus type 17.

[6200] VGAM446 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6201] An enzyme complex designated DICER COMPLEX, dices the VGAM446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM446 RNA is designated SEQ ID:3157, and is provided hereinbelow with reference to the sequence listing part.

[6202] VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6203] VGAM446 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM446 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[6204] The complementary binding of VGAM446 RNA, herein designated VGAM RNA, to host target binding sites on VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6205] It is appreciated that VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM446 host target genes. The mRNA of each one of this plurality of VGAM446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM446 RNA, herein designated VGAM RNA, and which when bound by VGAM446 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM446 host target proteins.

[6206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM446 gene, herein designated VGAM GENE, on one or more VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6207] It is yet further appreciated that a function of VGAM446 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM446 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 17. Specific functions, and accordingly utilities, of VGAM446 correlate with, and may be deduced from, the identity of the host target genes which VGAM446 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[6208] Nucleotide sequences of the VGAM446 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM446 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM446 are further described hereinbelow with reference to Table 1.

[6209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6210] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 447 (VGAM447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6211] VGAM447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM447 was detected is described hereinabove with reference to Figs. 2–8.

[6212] VGAM447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 40. VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6213] VGAM447 gene, herein designated VGAM GENE, encodes a VGAM447 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM447 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM447 precursor RNA is designated SEQ ID:433, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:433 is located at position 1456 relative to the genome of Human papillomavirus type 40.

[6214] VGAM447 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6215] An enzyme complex designated DICER COMPLEX, dices the VGAM447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM447 RNA is designated SEQ ID:3158, and is provided hereinbelow with reference to the sequence listing part.

[6216] VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6217] VGAM447 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6218] The complementary binding of VGAM447 RNA, herein designated VGAM RNA, to host target binding sites on VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6219] It is appreciated that VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM447 host target genes. The mRNA of each one of this plurality of VGAM447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM447 RNA, herein designated VGAM RNA, and which when bound by VGAM447 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM447 host target proteins.

[6220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM447 gene, herein designated VGAM GENE, on one or more VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6221] It is yet further appreciated that a function of VGAM447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 40. Specific functions, and accordingly utilities, of VGAM447 correlate with, and may be deduced from, the identity of the host target genes which VGAM447 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6222] Nucleotide sequences of the VGAM447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM447 are further described hereinbelow with reference to Table 1.

[6223] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6224] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 448 (VGAM448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6225] VGAM448 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM448 was detected is described hereinabove with reference to Figs. 2–8.

[6226] VGAM448 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 40. VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6227] VGAM448 gene, herein designated VGAM GENE, encodes a VGAM448 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM448 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM448 precursor RNA is designated SEQ ID:434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:434 is located at position 2267 relative to the genome of Human papillomavirus type 40.

[6228] VGAM448 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6229] An enzyme complex designated DICER COMPLEX, dices the VGAM448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM448 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM448 RNA is designated SEQ ID:3159, and is provided hereinbelow with reference to the sequence listing part.

[6230] VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6231] VGAM448 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM448 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6232] The complementary binding of VGAM448 RNA, herein designated VGAM RNA, to host target binding sites on VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6233] It is appreciated that VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM448 host target genes. The mRNA of each one of this plurality of VGAM448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM448 RNA, herein designated VGAM RNA, and which when bound by VGAM448 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM448 host target proteins.

[6234] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM448 gene, herein designated VGAM GENE, on one or more VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6235] It is yet further appreciated that a function of VGAM448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 40. Specific functions, and accordingly utilities, of VGAM448 correlate with, and may be deduced from, the

identity of the host target genes which VGAM448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6236] Nucleotide sequences of the VGAM448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM448 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM448 are further described hereinbelow with reference to Table 1.

[6237] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM448 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6238] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 449 (VGAM449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6239] VGAM449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM449 was detected is described hereinabove with reference to Figs. 2–8.

[6240] VGAM449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 7. VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6241] VGAM449 gene, herein designated VGAM GENE, encodes a VGAM449 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM449 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM449 precursor RNA is designated SEQ ID:435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:435 is located at position 5002 relative to the genome of Human papillomavirus type 7.

[6242] VGAM449 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM449 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6243] An enzyme complex designated DICER COMPLEX, dices the VGAM449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM449 RNA is designated SEQ ID:3160, and is provided hereinbelow with reference to the sequence listing part.

[6244] VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM449 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6245] VGAM449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6246] The complementary binding of VGAM449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM449 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6247] It is appreciated that VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM449 host target genes. The mRNA of each one of this plurality of VGAM449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM449 RNA, herein designated VGAM RNA, and which when bound by VGAM449 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM449 host target proteins.

[6248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM449 gene, herein designated VGAM GENE, on one or more VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6249] It is yet further appreciated that a function of VGAM449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 7. Specific functions, and accordingly utilities, of

VGAM449 correlate with, and may be deduced from, the identity of the host target genes which VGAM449 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6250] Nucleotide sequences of the VGAM449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM449 are further described hereinbelow with reference to Table 1.

[6251] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6252] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 450 (VGAM450) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[6253] VGAM450 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM450 was detected is described hereinabove with reference to Figs. 2–8.

[6254] VGAM450 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cardamine chlorotic fleck virus. VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6255] VGAM450 gene, herein designated VGAM GENE, encodes a VGAM450 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM450 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM450 precursor RNA is designated SEQ ID:436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:436 is located at position 43 relative to the genome of Cardamine chlorotic fleck virus.

[6256] VGAM450 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM450 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6257] An enzyme complex designated DICER COMPLEX, dices the VGAM450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM450 RNA is designated SEQ ID:3161, and is provided hereinbelow with reference to the sequence listing part.

[6258] VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM450 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6259] VGAM450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6260] The complementary binding of VGAM450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6261] It is appreciated that VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM450 host target genes. The mRNA of each one of this plurality of VGAM450 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM450 RNA, herein designated VGAM RNA, and which when bound by VGAM450 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM450 host target proteins.

[6262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM450 gene, herein designated VGAM GENE, on one or more VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6263] It is yet further appreciated that a function of VGAM450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of viral infection by Cardamine chlorotic fleck

virus. Specific functions, and accordingly utilities, of VGAM450 correlate with, and may be deduced from, the identity of the host target genes which VGAM450 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6264] Nucleotide sequences of the VGAM450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM450 are further described hereinbelow with reference to Table 1.

[6265] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM450 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6266] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 451 (VGAM451) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[6267] VGAM451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM451 was detected is described hereinabove with reference to Figs. 2–8.

[6268] VGAM451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cardamine chlorotic fleck virus. VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6269] VGAM451 gene, herein designated VGAM GENE, encodes a VGAM451 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM451 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM451 precursor RNA is designated SEQ ID:437, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:437 is located at position 694 relative to the genome of Cardamine chlorotic fleck virus.

[6270] VGAM451 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6271] An enzyme complex designated DICER COMPLEX, dices the VGAM451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM451 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM451 RNA is designated SEQ ID:3162, and is provided hereinbelow with reference to the sequence listing part.

[6272] VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6273] VGAM451 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM451 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM451 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6274] The complementary binding of VGAM451 RNA, herein designated VGAM RNA, to host target binding sites on VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6275] It is appreciated that VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM451 host target genes. The mRNA of each one of this plurality of VGAM451 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM451 RNA, herein designated VGAM RNA, and which when bound by VGAM451 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM451 host target proteins.

[6276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM451 gene, herein designated VGAM GENE, on one or more VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6277] It is yet further appreciated that a function of VGAM451 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM451 include diagnosis, prevention and

treatment of viral infection by Cardamine chlorotic fleck virus. Specific functions, and accordingly utilities, of VGAM451 correlate with, and may be deduced from, the identity of the host target genes which VGAM451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6278] Nucleotide sequences of the VGAM451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM451 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM451 are further described hereinbelow with reference to Table 1.

[6279] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6280] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 452 (VGAM452) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6281] VGAM452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM452 was detected is described hereinabove with reference to Figs. 2–8.

[6282] VGAM452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cardamine chlorotic fleck virus. VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6283] VGAM452 gene, herein designated VGAM GENE, encodes a VGAM452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM452 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM452 precursor RNA is designated SEQ ID:438, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:438 is located at position 2170 relative to the genome of Cardamine chlorotic fleck virus.

[6284] VGAM452 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6285] An enzyme complex designated DICER COMPLEX, dices the VGAM452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM452 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM452 RNA is designated SEQ ID:3163, and is provided hereinbelow with reference to the sequence listing part.

[6286] VGAM452 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6287] VGAM452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM452 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM452 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6288] The complementary binding of VGAM452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM452 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6289] It is appreciated that VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM452 host target genes. The mRNA of each one of this plurality of VGAM452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM452 RNA, herein designated VGAM

RNA, and which when bound by VGAM452 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM452 host target proteins.

[6290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM452 gene, herein designated VGAM GENE, on one or more VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6291] It is yet further appreciated that a function of VGAM452 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM452 include diagnosis, prevention and treatment of viral infection by Cardamine chlorotic fleck virus. Specific functions, and accordingly utilities, of VGAM452 correlate with, and may be deduced from, the identity of the host target genes which VGAM452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6292] Nucleotide sequences of the VGAM452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM452 are further described hereinbelow with reference to Table 1.

[6293] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6294] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 453 (VGAM453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6295] VGAM453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM453 was detected is described hereinabove with reference to Figs. 2–8.

[6296] VGAM453 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Borna disease virus. VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6297] VGAM453 gene, herein designated VGAM GENE, encodes a VGAM453 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM453 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM453 precursor RNA is designated SEQ ID:439, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:439 is located at position 5441 relative to

the genome of Borna disease virus.

[6298] VGAM453 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6299] An enzyme complex designated DICER COMPLEX, dices the VGAM453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM453 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM453 RNA is designated SEQ ID:3164, and is provided hereinbelow with reference to the sequence listing part.

[6300] VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6301] VGAM453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM453 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM453 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6302] The complementary binding of VGAM453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6303] It is appreciated that VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM453 host target genes. The mRNA of each one of this plurality of VGAM453 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM453 RNA, herein designated VGAM RNA, and which when bound by VGAM453 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM453 host target proteins.

[6304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM453 gene, herein designated VGAM GENE, on one or more VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6305] It is yet further appreciated that a function of VGAM453 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of viral infection by Borna disease virus. Specific functions, and accordingly utilities, of VGAM453 correlate with, and may be deduced from, the identity of the host target genes which VGAM453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6306] Nucleotide sequences of the VGAM453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM453 are further described hereinbelow with reference to Table 1.

[6307] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6308] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 454 (VGAM454) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6309] VGAM454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM454 was detected is described hereinabove with reference to Figs. 2–8.

[6310] VGAM454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Borna disease virus. VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6311] VGAM454 gene, herein designated VGAM GENE, encodes a VGAM454 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM454 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM454 precursor RNA is designated SEQ ID:440, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:440 is located at position 8313 relative to the genome of Bornavirus.

[6312] VGAM454 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6313] An enzyme complex designated DICER COMPLEX, dices the VGAM454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM454 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM454 RNA is designated SEQ ID:3165, and is provided hereinbelow with reference to the sequence

listing part.

[6314] VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6315] VGAM454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM454 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6316] The complementary binding of VGAM454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6317] It is appreciated that VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM454 host target genes. The mRNA of each one of this plurality of VGAM454 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM454 RNA, herein designated VGAM RNA, and which when bound by VGAM454 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM454 host target proteins.

[6318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM454 gene, herein designated VGAM GENE, on one or more VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6319] It is yet further appreciated that a function of VGAM454 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment of viral infection by Borna disease virus. Specific functions, and accordingly utilities, of VGAM454 correlate with, and may be deduced from, the identity of the host target genes which VGAM454 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[6320] Nucleotide sequences of the VGAM454 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM454 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM454 are further described hereinbelow with reference to Table 1.

[6321] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM454 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6322] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 455 (VGAM455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6323] VGAM455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM455 was detected is described hereinabove with reference to Figs. 2–8.

[6324] VGAM455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Borna disease virus. VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6325] VGAM455 gene, herein designated VGAM GENE, encodes a VGAM455 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM455 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM455 precursor RNA is designated SEQ ID:441, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:441 is located at position 5801 relative to the genome of Borna disease virus.

[6326] VGAM455 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6327] An enzyme complex designated DICER COMPLEX, dices the VGAM455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM455 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM455 RNA is designated SEQ ID:3166, and

is provided hereinbelow with reference to the sequence listing part.

[6328] VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6329] VGAM455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM455 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6330] The complementary binding of VGAM455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6331] It is appreciated that VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM455 host target genes. The mRNA of each one of this plurality of VGAM455 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM455 RNA, herein designated VGAM RNA, and which when bound by VGAM455 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM455 host target proteins.

[6332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM455 gene, herein designated VGAM GENE, on one or more VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6333] It is yet further appreciated that a function of VGAM455 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM455 include diagnosis, prevention and treatment of viral infection by Borna disease virus. Specific functions, and accordingly utilities, of VGAM455 correlate with, and may be deduced from, the identity of the host target genes which VGAM455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6334] Nucleotide sequences of the VGAM455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM455 are further described hereinbelow with reference to Table 1.

[6335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6336] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 456 (VGAM456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6337] VGAM456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM456 was detected is described hereinabove with reference to Figs. 2–8.

[6338] VGAM456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6339] VGAM456 gene, herein designated VGAM GENE, encodes a VGAM456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM456 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM456 precursor RNA is designated SEQ ID:442, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:442 is located at position 31089 relative to the genome of Variola virus.

[6340] VGAM456 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6341] An enzyme complex designated DICER COMPLEX, dices the VGAM456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM456 RNA is designated SEQ ID:3167, and

is provided hereinbelow with reference to the sequence listing part.

[6342] VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6343] VGAM456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM456 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6344] The complementary binding of VGAM456 RNA, herein designated VGAM RNA, to host target binding sites on VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6345] It is appreciated that VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM456 host target genes. The mRNA of each one of this plurality of VGAM456 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM456 RNA, herein designated VGAM RNA, and which when bound by VGAM456 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM456 host target proteins.

[6346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM456 gene, herein designated VGAM GENE, on one or more VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6347] It is yet further appreciated that a function of VGAM456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM456 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM456 correlate with, and may be deduced from, the identity of the host target genes which VGAM456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6348] Nucleotide sequences of the VGAM456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM456 are further described hereinbelow with reference to Table 1.

[6349] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM456 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6350] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 457 (VGAM457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6351] VGAM457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM457 was detected is described hereinabove with reference to Figs. 2–8.

[6352] VGAM457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6353] VGAM457 gene, herein designated VGAM GENE, encodes a VGAM457 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM457 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM457 precursor RNA is designated SEQ ID:443, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:443 is located at position 31432 relative to the genome of Variola virus.

[6354] VGAM457 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6355] An enzyme complex designated DICER COMPLEX, dices the VGAM457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM457 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM457 RNA is designated SEQ ID:3168, and

is provided hereinbelow with reference to the sequence listing part.

[6356] VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6357] VGAM457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6358] The complementary binding of VGAM457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6359] It is appreciated that VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM457 host target genes. The mRNA of each one of this plurality of VGAM457 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM457 RNA, herein designated VGAM RNA, and which when bound by VGAM457 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM457 host target proteins.

[6360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM457 gene, herein designated VGAM GENE, on one or more VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6361] It is yet further appreciated that a function of VGAM457 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM457 correlate with, and may be deduced from, the identity of the host target genes which VGAM457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6362] Nucleotide sequences of the VGAM457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM457 are further described hereinbelow with reference to Table 1.

[6363] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM457 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6364] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 458 (VGAM458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6365] VGAM458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM458 was detected is described hereinabove with reference to Figs. 2–8.

[6366] VGAM458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6367] VGAM458 gene, herein designated VGAM GENE, encodes a VGAM458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM458 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM458 precursor RNA is

designated SEQ ID:444, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:444 is located at position 72676 relative to the genome of Camelpox virus.

[6368] VGAM458 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6369] An enzyme complex designated DICER COMPLEX, dices the VGAM458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM458 RNA is designated SEQ ID:3169, and is provided hereinbelow with reference to the sequence listing part.

[6370] VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6371] VGAM458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6372] The complementary binding of VGAM458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM458 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6373] It is appreciated that VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM458 host target genes. The mRNA of

each one of this plurality of VGAM458 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM458 RNA, herein designated VGAM RNA, and which when bound by VGAM458 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM458 host target proteins.

[6374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM458 gene, herein designated VGAM GENE, on one or more VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[6375] It is yet further appreciated that a function of VGAM458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM458 correlate with, and may be deduced from, the identity of the host target genes which VGAM458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6376] Nucleotide sequences of the VGAM458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM458 are further described hereinbelow with reference to Table 1.

[6377] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM458 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[6378] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 459 (VGAM459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6379] VGAM459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM459 was detected is described hereinabove with reference to Figs. 2–8.

[6380] VGAM459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6381] VGAM459 gene, herein designated VGAM GENE, encodes a VGAM459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM459 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM459 precursor RNA is designated SEQ ID:445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:445 is located at position 78528 relative to the genome of Ectromelia virus.

[6382] VGAM459 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6383] An enzyme complex designated DICER COMPLEX, dices the VGAM459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM459 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM459 RNA is designated SEQ ID:3170, and is provided hereinbelow with reference to the sequence listing part.

[6384] VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6385] VGAM459 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6386] The complementary binding of VGAM459 RNA, herein designated VGAM RNA, to host target binding sites on VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6387] It is appreciated that VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM459 host target genes. The mRNA of each one of this plurality of VGAM459 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM459 RNA, herein designated VGAM RNA, and which when bound by VGAM459 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM459 host target proteins.

[6388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM459 gene, herein designated VGAM GENE, on one or more VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6389] It is yet further appreciated that a function of VGAM459 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM459 correlate with, and may be deduced from, the identity of the host target genes which VGAM459 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[6390] Nucleotide sequences of the VGAM459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM459 are further described hereinbelow with reference to Table 1.

[6391] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6392] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 460 (VGAM460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6393] VGAM460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM460 was detected is described hereinabove with reference to Figs. 2–8.

[6394] VGAM460 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6395] VGAM460 gene, herein designated VGAM GENE, encodes a VGAM460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM460 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM460 precursor RNA is designated SEQ ID:446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:446 is located at position 69643 relative to the genome of Variola virus.

[6396] VGAM460 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6397] An enzyme complex designated DICER COMPLEX, dices the VGAM460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM460 RNA is designated SEQ ID:3171, and is provided hereinbelow with reference to the sequence listing part.

[6398] VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6399] VGAM460 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM460 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6400] The complementary binding of VGAM460 RNA, herein designated VGAM RNA, to host target binding sites on VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6401] It is appreciated that VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM460 host target genes. The mRNA of each one of this plurality of VGAM460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM460 RNA, herein designated VGAM RNA, and which when bound by VGAM460 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM460 host target proteins.

[6402] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM460 gene, herein designated VGAM GENE, on one or more VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6403] It is yet further appreciated that a function of VGAM460 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM460 correlate with, and may be deduced from, the identity of the host target genes which VGAM460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6404] Nucleotide sequences of the VGAM460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM460 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM460 are further described hereinbelow with reference to Table 1.

[6405] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6406] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 461 (VGAM461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6407] VGAM461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM461 was detected is described hereinabove with reference to Figs. 2–8.

[6408] VGAM461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6409] VGAM461 gene, herein designated VGAM GENE, encodes a VGAM461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM461 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM461 precursor RNA is designated SEQ ID:447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:447 is located at position 119548 relative to the genome of Variola virus.

[6410] VGAM461 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6411] An enzyme complex designated DICER COMPLEX, dices the VGAM461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM461 RNA is designated SEQ ID:3172, and is provided hereinbelow with reference to the sequence listing part.

[6412] VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6413] VGAM461 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM461 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM461 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6414] The complementary binding of VGAM461 RNA, herein designated VGAM RNA, to host target binding sites on VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6415] It is appreciated that VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM461 host target genes. The mRNA of each one of this plurality of VGAM461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM461 RNA, herein designated VGAM RNA, and which when bound by VGAM461 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM461 host target proteins.

[6416] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM461 gene, herein designated VGAM GENE, on one or more VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6417] It is yet further appreciated that a function of VGAM461 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM461 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM461 correlate with, and may be deduced from, the identity of the host target genes which VGAM461 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6418] Nucleotide sequences of the VGAM461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM461 are further described hereinbelow with reference to Table 1.

[6419] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6420] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 462 (VGAM462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6421] VGAM462 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM462 was detected is described hereinabove with reference to Figs. 2–8.

[6422] VGAM462 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6423] VGAM462 gene, herein designated VGAM GENE, encodes a VGAM462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM462 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM462 precursor RNA is designated SEQ ID:448, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:448 is located at position 168878 relative to the genome of Variola virus.

[6424] VGAM462 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6425] An enzyme complex designated DICER COMPLEX, dices the VGAM462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM462 RNA is designated SEQ ID:3173, and is provided hereinbelow with reference to the sequence listing part.

[6426] VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6427] VGAM462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6428] The complementary binding of VGAM462 RNA, herein designated VGAM RNA, to host target binding sites on VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6429] It is appreciated that VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM462 host target genes. The mRNA of each one of this plurality of VGAM462 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM462 RNA, herein designated VGAM RNA, and which when bound by VGAM462 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM462 host target proteins.

[6430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM462 gene, herein designated VGAM GENE, on one or more VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6431] It is yet further appreciated that a function of VGAM462 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM462 correlate with, and may be deduced from, the identity of the host target genes which VGAM462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6432] Nucleotide sequences of the VGAM462 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM462 are further described hereinbelow with reference to Table 1.

[6433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6434] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 463 (VGAM463) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6435] VGAM463 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM463 was detected is described hereinabove with reference to Figs. 2–8.

[6436] VGAM463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6437] VGAM463 gene, herein designated VGAM GENE, encodes a VGAM463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM463 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM463 precursor RNA is designated SEQ ID:449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:449 is located at position 169316 relative to the genome of Variola virus.

[6438] VGAM463 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6439] An enzyme complex designated DICER COMPLEX, dices the VGAM463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM463 RNA is designated SEQ ID:3174, and is provided hereinbelow with reference to the sequence listing part.

[6440] VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6441] VGAM463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM463 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6442] The complementary binding of VGAM463 RNA, herein designated VGAM RNA, to host target binding sites on VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6443] It is appreciated that VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM463 host target genes. The mRNA of each one of this plurality of VGAM463 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM463 RNA, herein designated VGAM RNA, and which when bound by VGAM463 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM463 host target proteins.

[6444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM463 gene, herein designated VGAM GENE, on one or more VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6445] It is yet further appreciated that a function of VGAM463 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM463 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM463 correlate with, and may be deduced from, the identity of the host target genes which VGAM463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6446] Nucleotide sequences of the VGAM463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM463 are further described hereinbelow with reference to Table 1.

[6447] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6448] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 464 (VGAM464) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6449] VGAM464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM464 was detected is described hereinabove with reference to Figs. 2–8.

[6450] VGAM464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6451] VGAM464 gene, herein designated VGAM GENE, encodes a VGAM464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM464 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM464 precursor RNA is designated SEQ ID:450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:450 is located at position 170440 relative to the genome of Variola virus.

[6452] VGAM464 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6453] An enzyme complex designated DICER COMPLEX, dices the VGAM464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM464 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM464 RNA is designated SEQ ID:3175, and is provided hereinbelow with reference to the sequence listing part.

[6454] VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6455] VGAM464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM464 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6456] The complementary binding of VGAM464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6457] It is appreciated that VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM464 host target genes. The mRNA of each one of this plurality of VGAM464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM464 RNA, herein designated VGAM RNA, and which when bound by VGAM464 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM464 host target proteins.

[6458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM464 gene, herein designated VGAM GENE, on one or more VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6459] It is yet further appreciated that a function of VGAM464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM464 correlate with, and may be deduced from, the identity of the host target genes which VGAM464 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6460] Nucleotide sequences of the VGAM464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM464 are further described hereinbelow with reference to Table 1.

[6461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6462] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 465 (VGAM465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6463] VGAM465 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM465 was detected is described hereinabove with reference to Figs. 2–8.

[6464] VGAM465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6465] VGAM465 gene, herein designated VGAM GENE, encodes a VGAM465 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM465 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM465 precursor RNA is designated SEQ ID:451, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:451 is located at position 183993 relative to the genome of Variola virus.

[6466] VGAM465 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6467] An enzyme complex designated DICER COMPLEX, dices the VGAM465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM465 RNA is designated SEQ ID:3176, and is provided hereinbelow with reference to the sequence listing part.

[6468] VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6469] VGAM465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6470] The complementary binding of VGAM465 RNA, herein designated VGAM RNA, to host target binding sites on VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6471] It is appreciated that VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM465 host target genes. The mRNA of each one of this plurality of VGAM465 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM465 RNA, herein designated VGAM RNA, and which when bound by VGAM465 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM465 host target proteins.

[6472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM465 gene, herein designated VGAM GENE, on one or more VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6473] It is yet further appreciated that a function of VGAM465 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM465 correlate with, and may be deduced from, the identity of the host target genes which VGAM465 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6474] Nucleotide sequences of the VGAM465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM465 are further described hereinbelow with reference to Table 1.

[6475] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6476] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 466 (VGAM466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6477] VGAM466 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM466 was detected is described hereinabove with reference to Figs. 2–8.

[6478] VGAM466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Autographa californica nucleopolyhedrovirus. VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6479] VGAM466 gene, herein designated VGAM GENE, encodes a VGAM466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM466 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM466 precursor RNA is designated SEQ ID:452, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:452 is located at position 72494 relative to the genome of *Autographa californica* nucleopolyhedrovirus.

[6480] VGAM466 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6481] An enzyme complex designated DICER COMPLEX, dices the VGAM466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM466 RNA is designated SEQ ID:3177, and is provided hereinbelow with reference to the sequence listing part.

[6482] VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6483] VGAM466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM466 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6484] The complementary binding of VGAM466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6485] It is appreciated that VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM466 host target genes. The mRNA of each one of this plurality of VGAM466 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM466 RNA, herein designated VGAM RNA, and which when bound by VGAM466 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM466 host target proteins.

[6486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM466 gene, herein designated VGAM GENE, on one or more VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6487] It is yet further appreciated that a function of VGAM466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of viral infection by Autographa californica nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM466 correlate with, and may be deduced from, the identity of the host target genes which VGAM466 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6488] Nucleotide sequences of the VGAM466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM466 are further described hereinbelow with reference to Table 1.

[6489] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM466 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6490] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 467 (VGAM467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6491] VGAM467 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM467 was detected is described hereinabove with reference to Figs. 2–8.

[6492] VGAM467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Autographa californica nucleopolyhedrovirus. VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6493] VGAM467 gene, herein designated VGAM GENE, encodes a VGAM467 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM467 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM467 precursor RNA is designated SEQ ID:453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:453 is located at position 73764 relative to the genome of Autographa californica nucleopolyhedrovirus.

[6494] VGAM467 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6495] An enzyme complex designated DICER COMPLEX, dices the VGAM467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM467 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM467 RNA is designated SEQ ID:3178, and is provided hereinbelow with reference to the sequence listing part.

[6496] VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6497] VGAM467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM467 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6498] The complementary binding of VGAM467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM467 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6499] It is appreciated that VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM467 host target genes. The mRNA of each one of this plurality of VGAM467 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM467 RNA, herein designated VGAM RNA, and which when bound by VGAM467 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM467 host target proteins.

[6500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM467 gene, herein designated VGAM GENE, on one or more VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6501] It is yet further appreciated that a function of VGAM467 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of viral infection by Autographa californica nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM467 correlate with, and may be deduced from, the identity of the host target genes which VGAM467 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6502] Nucleotide sequences of the VGAM467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM467 are further described hereinbelow with reference to Table 1.

[6503] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6504] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 468 (VGAM468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6505] VGAM468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM468 was detected is described hereinabove with reference to Figs. 2-8.

[6506] VGAM468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6507] VGAM468 gene, herein designated VGAM GENE, encodes a

VGAM468 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM468 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM468 precursor RNA is designated SEQ ID:454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:454 is located at position 33653 relative to the genome of Equine herpesvirus 2.

[6508] VGAM468 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6509] An enzyme complex designated DICER COMPLEX, dices the VGAM468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM468 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM468 RNA is designated SEQ ID:3179, and is provided hereinbelow with reference to the sequence listing part.

[6510] VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6511] VGAM468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM468 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6512] The complementary binding of VGAM468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6513] It is appreciated that VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM468 host target genes. The mRNA of each one of this plurality of VGAM468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM468 RNA, herein designated VGAM RNA, and which when bound by VGAM468 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM468 host target proteins.

[6514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM468 gene, herein designated VGAM GENE, on one or more VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6515] It is yet further appreciated that a function of VGAM468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM468 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM468 correlate with, and may be deduced from, the identity of the host target genes which VGAM468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6516] Nucleotide sequences of the VGAM468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM468 are further de-

scribed hereinbelow with reference to Table 1.

[6517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6518] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 469 (VGAM469) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6519] VGAM469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM469 was detected is described hereinabove with reference to Figs. 2-8.

[6520] VGAM469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6521] VGAM469 gene, herein designated VGAM GENE, encodes a VGAM469 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM469 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM469 precursor RNA is designated SEQ ID:455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:455 is located at position 156830 relative to the genome of Equine herpesvirus 2.

[6522] VGAM469 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6523] An enzyme complex designated DICER COMPLEX, dices the VGAM469 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM469 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM469 RNA is designated SEQ ID:3180, and is provided hereinbelow with reference to the sequence listing part.

[6524] VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6525] VGAM469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6526] The complementary binding of VGAM469 RNA, herein designated VGAM RNA, to host target binding sites on VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM469 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6527] It is appreciated that VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM469 host target genes. The mRNA of each one of this plurality of VGAM469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM469 RNA, herein designated VGAM RNA, and which when bound by VGAM469 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM469 host target proteins.

[6528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM469 gene, herein designated VGAM GENE, on one or more VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6529] It is yet further appreciated that a function of VGAM469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM469 correlate with, and may be deduced from, the identity of the host target genes which VGAM469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6530] Nucleotide sequences of the VGAM469 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM469 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM469 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM469 are further described hereinbelow with reference to Table 1.

[6531] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM469 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6532] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 470 (VGAM470) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6533] VGAM470 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM470 was detected is described hereinabove with reference to Figs. 2-8.

[6534] VGAM470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[6535] VGAM470 gene, herein designated VGAM GENE, encodes a VGAM470 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM470 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM470 precursor RNA is designated SEQ ID:456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:456 is located at position 45550 relative to the genome of African swine fever virus.

[6536] VGAM470 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6537] An enzyme complex designated DICER COMPLEX, dices

the VGAM470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM470 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM470 RNA is designated SEQ ID:3181, and is provided hereinbelow with reference to the sequence listing part.

[6538] VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6539] VGAM470 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM470 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM470 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM470 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6540] The complementary binding of VGAM470 RNA, herein designated VGAM RNA, to host target binding sites on VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6541] It is appreciated that VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM470 host target genes. The mRNA of each one of this plurality of VGAM470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM470 RNA, herein designated VGAM RNA, and which when bound by VGAM470 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM470 host target proteins.

[6542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM470 gene, herein designated VGAM GENE, on one or more VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6543] It is yet further appreciated that a function of VGAM470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM470 correlate with, and may be deduced from, the identity of the host target genes which VGAM470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6544] Nucleotide sequences of the VGAM470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM470 are further described hereinbelow with reference to Table 1.

[6545] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6546] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 471 (VGAM471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6547] VGAM471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM471 was detected is described hereinabove with reference to Figs. 2-8.

[6548] VGAM471 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM471 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[6549] VGAM471 gene, herein designated VGAM GENE, encodes a VGAM471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM471 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM471 precursor RNA is designated SEQ ID:457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:457 is located at position 135287 relative to the genome of Human herpesvirus 6.

[6550] VGAM471 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6551] An enzyme complex designated DICER COMPLEX, dices the VGAM471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM471 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM471 RNA is designated SEQ ID:3182, and is provided hereinbelow with reference to the sequence listing part.

[6552] VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6553] VGAM471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM471 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6554] The complementary binding of VGAM471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM471 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6555] It is appreciated that VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM471 host target genes. The mRNA of each one of this plurality of VGAM471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM471 RNA, herein designated VGAM RNA, and which when bound by VGAM471 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM471 host target proteins.

[6556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM471 gene, herein designated VGAM GENE, on one or more VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6557] It is yet further appreciated that a function of VGAM471 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM471 correlate with, and may be deduced from, the identity of the host target genes which VGAM471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6558] Nucleotide sequences of the VGAM471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM471 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM471 are further described hereinbelow with reference to Table 1.

[6559] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6560] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 472 (VGAM472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6561] VGAM472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM472 was detected is described hereinabove with reference to Figs. 2-8.

[6562] VGAM472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis

virus. VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6563] VGAM472 gene, herein designated VGAM GENE, encodes a VGAM472 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM472 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM472 precursor RNA is designated SEQ ID:458, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:458 is located at position 8516 relative to the genome of Tick-borne encephalitis virus.

[6564] VGAM472 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[6565] An enzyme complex designated DICER COMPLEX, dices the VGAM472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM472 RNA is designated SEQ ID:3183, and is provided hereinbelow with reference to the sequence listing part.

[6566] VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6567] VGAM472 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6568] The complementary binding of VGAM472 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6569] It is appreciated that VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM472 host target genes. The mRNA of each one of this plurality of VGAM472 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM472 RNA, herein designated VGAM RNA, and which when bound by VGAM472 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM472 host target proteins.

[6570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM472 gene, herein designated VGAM GENE, on one or more VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6571] It is yet further appreciated that a function of VGAM472 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM472 correlate with, and may be deduced from, the identity of the host target genes which VGAM472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6572] Nucleotide sequences of the VGAM472 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM472 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM472 are further described hereinbelow with reference to Table 1.

[6573] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM472 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6574] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 473 (VGAM473) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6575] VGAM473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM473 was detected is described hereinabove with reference to Figs. 2-8.

[6576] VGAM473 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tick-borne encephalitis virus. VGAM473 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6577] VGAM473 gene, herein designated VGAM GENE, encodes a VGAM473 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM473 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM473 precursor RNA is designated SEQ ID:459, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:459 is located at position 9825 relative to the genome of Tick-borne encephalitis virus.

[6578] VGAM473 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6579] An enzyme complex designated DICER COMPLEX, dices the VGAM473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM473 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM473 RNA is designated SEQ ID:3184, and is provided hereinbelow with reference to the sequence listing part.

[6580] VGAM473 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6581] VGAM473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM473 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6582] The complementary binding of VGAM473 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6583] It is appreciated that VGAM473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM473 host target genes. The mRNA of each one of this plurality of VGAM473 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM473 RNA, herein designated VGAM RNA, and which when bound by VGAM473 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM473 host target proteins.

[6584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM473 gene, herein designated VGAM GENE, on one or more VGAM473 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6585] It is yet further appreciated that a function of VGAM473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM473 correlate with, and may be deduced from, the identity of the host target genes which VGAM473 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6586] Nucleotide sequences of the VGAM473 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM473 are further described hereinbelow with reference to Table 1.

[6587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6588] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 474 (VGAM474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6589] VGAM474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM474 was detected is described hereinabove with reference to Figs. 2-8.

[6590] VGAM474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis virus. VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6591] VGAM474 gene, herein designated VGAM GENE, encodes a VGAM474 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM474 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM474 precursor RNA is designated SEQ ID:460, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:460 is located at position 7427 relative to the genome of Tick-borne encephalitis virus.

[6592] VGAM474 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6593] An enzyme complex designated DICER COMPLEX, dices the VGAM474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM474 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM474 RNA is designated SEQ ID:3185, and is provided hereinbelow with reference to the sequence listing part.

[6594] VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[6595] VGAM474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6596] The complementary binding of VGAM474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6597] It is appreciated that VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM474 host target genes. The mRNA of each one of this plurality of VGAM474 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM474 RNA, herein designated VGAM RNA, and which when bound by VGAM474 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM474 host target proteins.

[6598] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM474 gene, herein designated VGAM GENE, on one or

more VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6599] It is yet further appreciated that a function of VGAM474 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM474 correlate with, and may be deduced from, the identity of the host target genes which VGAM474 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6600] Nucleotide sequences of the VGAM474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM474 are further described hereinbelow with reference to Table 1.

[6601] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM474 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6602] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 475 (VGAM475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6603] VGAM475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM475 was detected is described

hereinabove with reference to Figs. 2–8.

[6604] VGAM475 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis virus. VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6605] VGAM475 gene, herein designated VGAM GENE, encodes a VGAM475 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM475 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM475 precursor RNA is designated SEQ ID:461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:461 is located at position 606 relative to the genome of Tick-borne encephalitis virus.

[6606] VGAM475 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6607] An enzyme complex designated DICER COMPLEX, dices the VGAM475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM475 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM475 RNA is designated SEQ ID:3186, and is provided hereinbelow with reference to the sequence listing part.

[6608] VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6609] VGAM475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[6610] The complementary binding of VGAM475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM475 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6611] It is appreciated that VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM475 host target genes. The mRNA of each one of this plurality of VGAM475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM475 RNA, herein designated VGAM RNA, and which when bound by VGAM475 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM475 host target proteins.

[6612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM475 gene, herein designated VGAM GENE, on one or more VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6613] It is yet further appreciated that a function of VGAM475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM475 correlate with, and may be deduced from, the identity of the host target genes which VGAM475 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[6614] Nucleotide sequences of the VGAM475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM475 are further described hereinbelow with reference to Table 1.

[6615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6616] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 476 (VGAM476) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6617] VGAM476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM476 was detected is described hereinabove with reference to Figs. 2–8.

[6618] VGAM476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne encephalitis virus. VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6619] VGAM476 gene, herein designated VGAM GENE, encodes a VGAM476 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM476 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM476 precursor RNA is designated SEQ ID:462, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:462 is located at position 8886 relative to the genome of Tick-borne encephalitis virus.

[6620] VGAM476 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6621] An enzyme complex designated DICER COMPLEX, dices the VGAM476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM476 RNA is designated SEQ ID:3187, and is provided hereinbelow with reference to the sequence listing part.

[6622] VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6623] VGAM476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM476 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6624] The complementary binding of VGAM476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6625] It is appreciated that VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM476 host target genes. The mRNA of each one of this plurality of VGAM476 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM476 RNA, herein designated VGAM RNA, and which when bound by VGAM476 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM476 host target proteins.

[6626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM476 gene, herein designated VGAM GENE, on one or more VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6627] It is yet further appreciated that a function of VGAM476 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of viral infection by Tick-borne encephalitis virus. Specific functions, and accordingly utilities, of VGAM476 correlate with, and may be deduced from, the identity of the host target genes which VGAM476 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6628] Nucleotide sequences of the VGAM476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM476 are further described hereinbelow with reference to Table 1.

[6629] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM476 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6630] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 477 (VGAM477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6631] VGAM477 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM477 was detected is described hereinabove with reference to Figs. 2–8.

[6632] VGAM477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus.

VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6633] VGAM477 gene, herein designated VGAM GENE, encodes a VGAM477 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM477 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM477 precursor RNA is designated SEQ ID:463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:463 is located at position 6061 relative to the genome of Hepatitis G virus.

[6634] VGAM477 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6635] An enzyme complex designated DICER COMPLEX, dices the VGAM477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM477 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM477 RNA is designated SEQ ID:3188, and is provided hereinbelow with reference to the sequence listing part.

[6636] VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6637] VGAM477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6638] The complementary binding of VGAM477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6639] It is appreciated that VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM477 host target genes. The mRNA of each one of this plurality of VGAM477 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM477 RNA, herein designated VGAM RNA, and which when bound by VGAM477 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM477 host target proteins.

[6640] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM477 gene, herein designated VGAM GENE, on one or more VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6641] It is yet further appreciated that a function of VGAM477 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM477 correlate with, and may be deduced from, the identity of the host

target genes which VGAM477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6642] Nucleotide sequences of the VGAM477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM477 are further described hereinbelow with reference to Table 1.

[6643] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6644] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 478 (VGAM478) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6645] VGAM478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM478 was detected is described hereinabove with reference to Figs. 2–8.

[6646] VGAM478 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus.

VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6647] VGAM478 gene, herein designated VGAM GENE, encodes a VGAM478 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM478 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM478 precursor RNA is designated SEQ ID:464, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:464 is located at position 8794 relative to the genome of Hepatitis G virus.

[6648] VGAM478 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM478 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6649] An enzyme complex designated DICER COMPLEX, dices the VGAM478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM478 RNA is designated SEQ ID:3189, and is provided hereinbelow with reference to the sequence listing part.

[6650] VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM478 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6651] VGAM478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6652] The complementary binding of VGAM478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6653] It is appreciated that VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM478 host target genes. The mRNA of each one of this plurality of VGAM478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM478 RNA, herein designated VGAM RNA, and which when bound by VGAM478 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM478 host target proteins.

[6654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM478 gene, herein designated VGAM GENE, on one or more VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6655] It is yet further appreciated that a function of VGAM478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM478 correlate

with, and may be deduced from, the identity of the host target genes which VGAM478 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6656] Nucleotide sequences of the VGAM478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM478 are further described hereinbelow with reference to Table 1.

[6657] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM478 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6658] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 479 (VGAM479) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[6659] VGAM479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM479 was detected is described hereinabove with reference to Figs. 2–8.

[6660] VGAM479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6661] VGAM479 gene, herein designated VGAM GENE, encodes a VGAM479 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM479 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM479 precursor RNA is designated SEQ ID:465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:465 is located at position 3988 relative to the genome of Hepatitis G virus.

[6662] VGAM479 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM479 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6663] An enzyme complex designated DICER COMPLEX, dices the VGAM479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM479 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM479 RNA is designated SEQ ID:3190, and is provided hereinbelow with reference to the sequence listing part.

[6664] VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM479 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6665] VGAM479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM479 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6666] The complementary binding of VGAM479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM479 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6667] It is appreciated that VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM479 host target genes. The mRNA of each one of this plurality of VGAM479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM479 RNA, herein designated VGAM RNA, and which when bound by VGAM479 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM479 host target proteins.

[6668] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM479 gene, herein designated VGAM GENE, on one or more VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6669] It is yet further appreciated that a function of VGAM479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM479 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific

functions, and accordingly utilities, of VGAM479 correlate with, and may be deduced from, the identity of the host target genes which VGAM479 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6670] Nucleotide sequences of the VGAM479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM479 are further described hereinbelow with reference to Table 1.

[6671] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6672] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 480 (VGAM480) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[6673] VGAM480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM480 was detected is described hereinabove with reference to Figs. 2–8.

[6674] VGAM480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6675] VGAM480 gene, herein designated VGAM GENE, encodes a VGAM480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM480 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM480 precursor RNA is designated SEQ ID:466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:466 is located at position 4279 relative to the genome of Hepatitis G virus.

[6676] VGAM480 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6677] An enzyme complex designated DICER COMPLEX, dices the VGAM480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM480 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM480 RNA is designated SEQ ID:3191, and is provided hereinbelow with reference to the sequence listing part.

[6678] VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6679] VGAM480 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM480 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM480 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6680] The complementary binding of VGAM480 RNA, herein designated VGAM RNA, to host target binding sites on VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6681] It is appreciated that VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM480 host target genes. The mRNA of each one of this plurality of VGAM480 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM480 RNA, herein designated VGAM RNA, and which when bound by VGAM480 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM480 host target proteins.

[6682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM480 gene, herein designated VGAM GENE, on one or more VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6683] It is yet further appreciated that a function of VGAM480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM480 include diagnosis, prevention and

treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM480 correlate with, and may be deduced from, the identity of the host target genes which VGAM480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6684] Nucleotide sequences of the VGAM480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM480 are further described hereinbelow with reference to Table 1.

[6685] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM480 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6686] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 481 (VGAM481) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6687] VGAM481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM481 was detected is described hereinabove with reference to Figs. 2–8.

[6688] VGAM481 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6689] VGAM481 gene, herein designated VGAM GENE, encodes a VGAM481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM481 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM481 precursor RNA is designated SEQ ID:467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:467 is located at position 2786 relative to the genome of Hepatitis G virus.

[6690] VGAM481 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6691] An enzyme complex designated DICER COMPLEX, dices the VGAM481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM481 RNA is designated SEQ ID:3192, and is provided hereinbelow with reference to the sequence listing part.

[6692] VGAM481 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6693] VGAM481 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM481 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6694] The complementary binding of VGAM481 RNA, herein designated VGAM RNA, to host target binding sites on VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6695] It is appreciated that VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM481 host target genes. The mRNA of each one of this plurality of VGAM481 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM481 RNA, herein designated VGAM

RNA, and which when bound by VGAM481 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM481 host target proteins.

[6696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM481 gene, herein designated VGAM GENE, on one or more VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6697] It is yet further appreciated that a function of VGAM481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM481 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM481 correlate with, and may be deduced from, the identity of the host target genes which VGAM481 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[6698] Nucleotide sequences of the VGAM481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM481 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM481 are further described hereinbelow with reference to Table 1.

[6699] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM481 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6700] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes–

senger 482 (VGAM482) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6701] VGAM482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM482 was detected is described hereinabove with reference to Figs. 2–8.

[6702] VGAM482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6703] VGAM482 gene, herein designated VGAM GENE, encodes a VGAM482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM482 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM482 precursor RNA is designated SEQ ID:468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:468 is located at position 2953 relative to

the genome of Hepatitis G virus.

[6704] VGAM482 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6705] An enzyme complex designated DICER COMPLEX, dices the VGAM482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM482 RNA is designated SEQ ID:3193, and is provided hereinbelow with reference to the sequence listing part.

[6706] VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6707] VGAM482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM482 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6708] The complementary binding of VGAM482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM482 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6709] It is appreciated that VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM482 host target genes. The mRNA of each one of this plurality of VGAM482 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM482 RNA, herein designated VGAM RNA, and which when bound by VGAM482 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM482 host target proteins.

[6710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM482 gene, herein designated VGAM GENE, on one or more VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6711] It is yet further appreciated that a function of VGAM482 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM482 correlate with, and may be deduced from, the identity of the host target genes which VGAM482 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6712] Nucleotide sequences of the VGAM482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM482 are further described hereinbelow with reference to Table 1.

[6713] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6714] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 483 (VGAM483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6715] VGAM483 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM483 was detected is described hereinabove with reference to Figs. 2–8.

[6716] VGAM483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6717] VGAM483 gene, herein designated VGAM GENE, encodes a VGAM483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM483 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM483 precursor RNA is designated SEQ ID:469, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:469 is located at position 4804 relative to the genome of Hepatitis G virus.

[6718] VGAM483 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6719] An enzyme complex designated DICER COMPLEX, dices the VGAM483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM483 RNA is designated SEQ ID:3194, and is provided hereinbelow with reference to the sequence

listing part.

[6720] VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6721] VGAM483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM483 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM483 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6722] The complementary binding of VGAM483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6723] It is appreciated that VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM483 host target genes. The mRNA of each one of this plurality of VGAM483 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM483 RNA, herein designated VGAM RNA, and which when bound by VGAM483 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM483 host target proteins.

[6724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM483 gene, herein designated VGAM GENE, on one or more VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6725] It is yet further appreciated that a function of VGAM483 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM483 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM483 correlate with, and may be deduced from, the identity of the host target genes which VGAM483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6726] Nucleotide sequences of the VGAM483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM483 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM483 are further described hereinbelow with reference to Table 1.

[6727] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6728] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 484 (VGAM484) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6729] VGAM484 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM484 was detected is described hereinabove with reference to Figs. 2–8.

[6730] VGAM484 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6731] VGAM484 gene, herein designated VGAM GENE, encodes a VGAM484 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM484 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM484 precursor RNA is designated SEQ ID:470, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:470 is located at position 6210 relative to the genome of Hepatitis G virus.

[6732] VGAM484 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6733] An enzyme complex designated DICER COMPLEX, dices the VGAM484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM484 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM484 RNA is designated SEQ ID:3195, and

is provided hereinbelow with reference to the sequence listing part.

[6734] VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6735] VGAM484 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM484 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6736] The complementary binding of VGAM484 RNA, herein designated VGAM RNA, to host target binding sites on VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM484 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6737] It is appreciated that VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM484 host target genes. The mRNA of each one of this plurality of VGAM484 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM484 RNA, herein designated VGAM RNA, and which when bound by VGAM484 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM484 host target proteins.

[6738] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM484 gene, herein designated VGAM GENE, on one or more VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6739] It is yet further appreciated that a function of VGAM484 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM484 correlate with, and may be deduced from, the identity of the host target genes which VGAM484 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6740] Nucleotide sequences of the VGAM484 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM484 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM484 are further described hereinbelow with reference to Table 1.

[6741] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM484 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6742] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 485 (VGAM485) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6743] VGAM485 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM485 was detected is described hereinabove with reference to Figs. 2–8.

[6744] VGAM485 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6745] VGAM485 gene, herein designated VGAM GENE, encodes a VGAM485 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM485 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM485 precursor RNA is

designated SEQ ID:471, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:471 is located at position 1462 relative to the genome of Hepatitis G virus.

[6746] VGAM485 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6747] An enzyme complex designated DICER COMPLEX, dices the VGAM485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM485 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide se-

quence of VGAM485 RNA is designated SEQ ID:3196, and is provided hereinbelow with reference to the sequence listing part.

[6748] VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6749] VGAM485 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM485 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM485 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6750] The complementary binding of VGAM485 RNA, herein designated VGAM RNA, to host target binding sites on VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM485 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6751] It is appreciated that VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM485 host target genes. The mRNA of

each one of this plurality of VGAM485 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM485 RNA, herein designated VGAM RNA, and which when bound by VGAM485 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM485 host target proteins.

[6752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM485 gene, herein designated VGAM GENE, on one or more VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[6753] It is yet further appreciated that a function of VGAM485 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM485 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM485 correlate with, and may be deduced from, the identity of the host target genes which VGAM485 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6754] Nucleotide sequences of the VGAM485 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM485 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM485 are further described hereinbelow with reference to Table 1.

[6755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM485 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[6756] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 486 (VGAM486) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6757] VGAM486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM486 was detected is described hereinabove with reference to Figs. 2–8.

[6758] VGAM486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6759] VGAM486 gene, herein designated VGAM GENE, encodes a VGAM486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM486 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM486 precursor RNA is designated SEQ ID:472, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:472 is located at position 5080 relative to the genome of Hepatitis G virus.

[6760] VGAM486 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6761] An enzyme complex designated DICER COMPLEX, dices the VGAM486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM486 RNA is designated SEQ ID:3197, and is provided hereinbelow with reference to the sequence listing part.

[6762] VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6763] VGAM486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM486 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6764] The complementary binding of VGAM486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM486 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6765] It is appreciated that VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM486 host target genes. The mRNA of each one of this plurality of VGAM486 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM486 RNA, herein designated VGAM RNA, and which when bound by VGAM486 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM486 host target proteins.

[6766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM486 gene, herein designated VGAM GENE, on one or more VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[6767] It is yet further appreciated that a function of VGAM486 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM486 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM486 correlate with, and may be deduced from, the identity of the host target genes which VGAM486 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[6768] Nucleotide sequences of the VGAM486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM486 are further described hereinbelow with reference to Table 1.

[6769] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6770] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 487 (VGAM487) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6771] VGAM487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM487 was detected is described hereinabove with reference to Figs. 2–8.

[6772] VGAM487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6773] VGAM487 gene, herein designated VGAM GENE, encodes a VGAM487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM487 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM487 precursor RNA is designated SEQ ID:473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:473 is located at position 9016 relative to the genome of Hepatitis G virus.

[6774] VGAM487 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6775] An enzyme complex designated DICER COMPLEX, dices the VGAM487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM487 RNA is designated SEQ ID:3198, and is provided hereinbelow with reference to the sequence listing part.

[6776] VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6777] VGAM487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM487 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6778] The complementary binding of VGAM487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6779] It is appreciated that VGAM487 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM487 host target genes. The mRNA of each one of this plurality of VGAM487 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM487 RNA, herein designated VGAM RNA, and which when bound by VGAM487 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM487 host target proteins.

[6780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM487 gene, herein designated VGAM GENE, on one or more VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6781] It is yet further appreciated that a function of VGAM487 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM487 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM487 correlate with, and may be deduced from, the identity of the host target genes which VGAM487 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6782] Nucleotide sequences of the VGAM487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM487 are further described hereinbelow with reference to Table 1.

[6783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM487 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6784] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 488 (VGAM488) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6785] VGAM488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM488 was detected is described hereinabove with reference to Figs. 2–8.

[6786] VGAM488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus.

VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6787] VGAM488 gene, herein designated VGAM GENE, encodes a VGAM488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM488 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM488 precursor RNA is designated SEQ ID:474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:474 is located at position 2231 relative to the genome of Hepatitis G virus.

[6788] VGAM488 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6789] An enzyme complex designated DICER COMPLEX, dices the VGAM488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM488 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM488 RNA is designated SEQ ID:3199, and is provided hereinbelow with reference to the sequence listing part.

[6790] VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6791] VGAM488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6792] The complementary binding of VGAM488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6793] It is appreciated that VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM488 host target genes. The mRNA of each one of this plurality of VGAM488 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM488 RNA, herein designated VGAM RNA, and which when bound by VGAM488 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM488 host target proteins.

[6794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM488 gene, herein designated VGAM GENE, on one or more VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6795] It is yet further appreciated that a function of VGAM488 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM488 correlate with, and may be deduced from, the identity of the host target genes which VGAM488 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6796] Nucleotide sequences of the VGAM488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM488 are further described hereinbelow with reference to Table 1.

[6797] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6798] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 489 (VGAM489) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6799] VGAM489 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM489 was detected is described hereinabove with reference to Figs. 2–8.

[6800] VGAM489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus.

VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6801] VGAM489 gene, herein designated VGAM GENE, encodes a VGAM489 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM489 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM489 precursor RNA is designated SEQ ID:475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:475 is located at position 8122 relative to the genome of Hepatitis G virus.

[6802] VGAM489 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6803] An enzyme complex designated DICER COMPLEX, dices the VGAM489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM489 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM489 RNA is designated SEQ ID:3200, and is provided hereinbelow with reference to the sequence listing part.

[6804] VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6805] VGAM489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6806] The complementary binding of VGAM489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM489 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[6807] It is appreciated that VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM489 host target genes. The mRNA of each one of this plurality of VGAM489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM489 RNA, herein designated VGAM RNA, and which when bound by VGAM489 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM489 host target proteins.

[6808] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM489 gene, herein designated VGAM GENE, on one or more VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6809] It is yet further appreciated that a function of VGAM489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM489 correlate with, and may be deduced from, the identity of the host target genes which VGAM489 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6810] Nucleotide sequences of the VGAM489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM489 are further described hereinbelow with reference to Table 1.

[6811] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6812] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 490 (VGAM490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6813] VGAM490 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM490 was detected is described hereinabove with reference to Figs. 2-8.

[6814] VGAM490 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6815] VGAM490 gene, herein designated VGAM GENE, encodes a VGAM490 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM490 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM490 precursor RNA is designated SEQ ID:476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:476 is located at position 776 relative to the genome of Hepatitis G virus.

[6816] VGAM490 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6817] An enzyme complex designated DICER COMPLEX, dices the VGAM490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM490 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM490 RNA is designated SEQ ID:3201, and is provided hereinbelow with reference to the sequence listing part.

[6818] VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6819] VGAM490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM490 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6820] The complementary binding of VGAM490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM490 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6821] It is appreciated that VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM490 host target genes. The mRNA of each one of this plurality of VGAM490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM490 RNA, herein designated VGAM RNA, and which when bound by VGAM490 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM490 host target proteins.

[6822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM490 gene, herein designated VGAM GENE, on one or more VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6823] It is yet further appreciated that a function of VGAM490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM490 correlate with, and may be deduced from, the identity of the host target genes which VGAM490 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6824] Nucleotide sequences of the VGAM490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM490 are further described hereinbelow with reference to Table 1.

[6825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM490 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6826] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 491 (VGAM491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6827] VGAM491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM491 was detected is described hereinabove with reference to Figs. 2-8.

[6828] VGAM491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6829] VGAM491 gene, herein designated VGAM GENE, encodes a

VGAM491 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM491 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM491 precursor RNA is designated SEQ ID:477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:477 is located at position 1627 relative to the genome of Hepatitis G virus.

[6830] VGAM491 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6831] An enzyme complex designated DICER COMPLEX, dices the VGAM491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM491 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM491 RNA is designated SEQ ID:3202, and is provided hereinbelow with reference to the sequence listing part.

[6832] VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6833] VGAM491 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM491 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6834] The complementary binding of VGAM491 RNA, herein designated VGAM RNA, to host target binding sites on VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6835] It is appreciated that VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM491 host target genes. The mRNA of each one of this plurality of VGAM491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM491 RNA, herein designated VGAM RNA, and which when bound by VGAM491 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM491 host target proteins.

[6836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM491 gene, herein designated VGAM GENE, on one or more VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6837] It is yet further appreciated that a function of VGAM491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM491 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM491 correlate with, and may be deduced from, the identity of the host target genes which VGAM491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6838] Nucleotide sequences of the VGAM491 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM491 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM491 are further de-

scribed hereinbelow with reference to Table 1.

[6839] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM491 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6840] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 492 (VGAM492) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6841] VGAM492 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM492 was detected is described hereinabove with reference to Figs. 2-8.

[6842] VGAM492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6843] VGAM492 gene, herein designated VGAM GENE, encodes a VGAM492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM492 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM492 precursor RNA is designated SEQ ID:478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:478 is located at position 4128 relative to the genome of Hepatitis G virus.

[6844] VGAM492 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6845] An enzyme complex designated DICER COMPLEX, dices the VGAM492 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM492 RNA is designated SEQ ID:3203, and is provided hereinbelow with reference to the sequence listing part.

[6846] VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6847] VGAM492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6848] The complementary binding of VGAM492 RNA, herein designated VGAM RNA, to host target binding sites on VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM492 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6849] It is appreciated that VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM492 host target genes. The mRNA of each one of this plurality of VGAM492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM492 RNA, herein designated VGAM RNA, and which when bound by VGAM492 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM492 host target proteins.

[6850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM492 gene, herein designated VGAM GENE, on one or more VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6851] It is yet further appreciated that a function of VGAM492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM492 correlate with, and may be deduced from, the identity of the host target genes which VGAM492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6852] Nucleotide sequences of the VGAM492 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM492 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM492 are further described hereinbelow with reference to Table 1.

[6853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6854] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 493 (VGAM493) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6855] VGAM493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM493 was detected is described hereinabove with reference to Figs. 2-8.

[6856] VGAM493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[6857] VGAM493 gene, herein designated VGAM GENE, encodes a VGAM493 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM493 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM493 precursor RNA is designated SEQ ID:479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:479 is located at position 7135 relative to the genome of Hepatitis G virus.

[6858] VGAM493 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6859] An enzyme complex designated DICER COMPLEX, dices

the VGAM493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM493 RNA is designated SEQ ID:3204, and is provided hereinbelow with reference to the sequence listing part.

[6860] VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6861] VGAM493 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM493 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM493 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6862] The complementary binding of VGAM493 RNA, herein designated VGAM RNA, to host target binding sites on VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6863] It is appreciated that VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM493 host target genes. The mRNA of each one of this plurality of VGAM493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM493 RNA, herein designated VGAM RNA, and which when bound by VGAM493 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM493 host target proteins.

[6864] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM493 gene, herein designated VGAM GENE, on one or more VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6865] It is yet further appreciated that a function of VGAM493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM493 correlate with, and may be deduced from, the identity of the host target genes which VGAM493 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6866] Nucleotide sequences of the VGAM493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM493 are further described hereinbelow with reference to Table 1.

[6867] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6868] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 494 (VGAM494) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6869] VGAM494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM494 was detected is described hereinabove with reference to Figs. 2-8.

[6870] VGAM494 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus. VGAM494 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[6871] VGAM494 gene, herein designated VGAM GENE, encodes a VGAM494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM494 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM494 precursor RNA is designated SEQ ID:480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:480 is located at position 4566 relative to the genome of Hepatitis G virus.

[6872] VGAM494 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6873] An enzyme complex designated DICER COMPLEX, dices the VGAM494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM494 RNA is designated SEQ ID:3205, and is provided hereinbelow with reference to the sequence listing part.

[6874] VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6875] VGAM494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM494 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6876] The complementary binding of VGAM494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM494 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6877] It is appreciated that VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM494 host target genes. The mRNA of each one of this plurality of VGAM494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM494 RNA, herein designated VGAM RNA, and which when bound by VGAM494 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM494 host target proteins.

[6878] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM494 gene, herein designated VGAM GENE, on one or more VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6879] It is yet further appreciated that a function of VGAM494 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM494 correlate with, and may be deduced from, the identity of the host target genes which VGAM494 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6880] Nucleotide sequences of the VGAM494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM494 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM494 are further described hereinbelow with reference to Table 1.

[6881] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6882] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 495 (VGAM495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6883] VGAM495 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM495 was detected is described hereinabove with reference to Figs. 2-8.

[6884] VGAM495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G virus.

VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6885] VGAM495 gene, herein designated VGAM GENE, encodes a VGAM495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM495 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM495 precursor RNA is designated SEQ ID:481, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:481 is located at position 3092 relative to the genome of Hepatitis G virus.

[6886] VGAM495 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[6887] An enzyme complex designated DICER COMPLEX, dices the VGAM495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM495 RNA is designated SEQ ID:3206, and is provided hereinbelow with reference to the sequence listing part.

[6888] VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6889] VGAM495 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM495 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6890] The complementary binding of VGAM495 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6891] It is appreciated that VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM495 host target genes. The mRNA of each one of this plurality of VGAM495 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM495 RNA, herein designated VGAM RNA, and which when bound by VGAM495 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM495 host target proteins.

[6892] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM495 gene, herein designated VGAM GENE, on one or more VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6893] It is yet further appreciated that a function of VGAM495 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM495 include diagnosis, prevention and treatment of viral infection by Hepatitis G virus. Specific functions, and accordingly utilities, of VGAM495 correlate with, and may be deduced from, the identity of the host target genes which VGAM495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6894] Nucleotide sequences of the VGAM495 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM495 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM495 are further described hereinbelow with reference to Table 1.

[6895] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM495 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6896] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 496 (VGAM496) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6897] VGAM496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM496 was detected is described hereinabove with reference to Figs. 2-8.

[6898] VGAM496 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 7. VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6899] VGAM496 gene, herein designated VGAM GENE, encodes a VGAM496 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM496 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM496 precursor RNA is designated SEQ ID:482, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:482 is located at position 58821 relative to the genome of Human herpesvirus 7.

[6900] VGAM496 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6901] An enzyme complex designated DICER COMPLEX, dices the VGAM496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM496 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM496 RNA is designated SEQ ID:3207, and is provided hereinbelow with reference to the sequence listing part.

[6902] VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6903] VGAM496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM496 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6904] The complementary binding of VGAM496 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6905] It is appreciated that VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM496 host target genes. The mRNA of each one of this plurality of VGAM496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM496 RNA, herein designated VGAM RNA, and which when bound by VGAM496 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM496 host target proteins.

[6906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM496 gene, herein designated VGAM GENE, on one or more VGAM496 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6907] It is yet further appreciated that a function of VGAM496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM496 correlate with, and may be deduced from, the identity of the host target genes which VGAM496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6908] Nucleotide sequences of the VGAM496 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM496 are further described hereinbelow with reference to Table 1.

[6909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM496 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6910] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 497 (VGAM497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6911] VGAM497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM497 was detected is described hereinabove with reference to Figs. 2-8.

[6912] VGAM497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6913] VGAM497 gene, herein designated VGAM GENE, encodes a VGAM497 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM497 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM497 precursor RNA is designated SEQ ID:483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:483 is located at position 58211 relative to the genome of Human herpesvirus 7.

[6914] VGAM497 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6915] An enzyme complex designated DICER COMPLEX, dices the VGAM497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM497 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM497 RNA is designated SEQ ID:3208, and is provided hereinbelow with reference to the sequence listing part.

[6916] VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[6917] VGAM497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6918] The complementary binding of VGAM497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6919] It is appreciated that VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM497 host target genes. The mRNA of each one of this plurality of VGAM497 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM497 RNA, herein designated VGAM RNA, and which when bound by VGAM497 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM497 host target proteins.

[6920] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM497 gene, herein designated VGAM GENE, on one or

more VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6921] It is yet further appreciated that a function of VGAM497 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM497 correlate with, and may be deduced from, the identity of the host target genes which VGAM497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6922] Nucleotide sequences of the VGAM497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM497 are further described hereinbelow with reference to Table 1.

[6923] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6924] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 498 (VGAM498) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6925] VGAM498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM498 was detected is described

hereinabove with reference to Figs. 2–8.

[6926] VGAM498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6927] VGAM498 gene, herein designated VGAM GENE, encodes a VGAM498 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM498 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM498 precursor RNA is designated SEQ ID:484, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:484 is located at position 127367 relative to the genome of Human herpesvirus 7.

[6928] VGAM498 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6929] An enzyme complex designated DICER COMPLEX, dices the VGAM498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM498 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM498 RNA is designated SEQ ID:3209, and is provided hereinbelow with reference to the sequence listing part.

[6930] VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6931] VGAM498 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[6932] The complementary binding of VGAM498 RNA, herein designated VGAM RNA, to host target binding sites on VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6933] It is appreciated that VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM498 host target genes. The mRNA of each one of this plurality of VGAM498 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM498 RNA, herein designated VGAM RNA, and which when bound by VGAM498 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM498 host target proteins.

[6934] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM498 gene, herein designated VGAM GENE, on one or more VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6935] It is yet further appreciated that a function of VGAM498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM498 correlate with, and may be deduced from, the identity of the host target genes which VGAM498 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[6936] Nucleotide sequences of the VGAM498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM498 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM498 are further described hereinbelow with reference to Table 1.

[6937] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM498 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6938] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 499 (VGAM499) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6939] VGAM499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM499 was detected is described hereinabove with reference to Figs. 2–8.

[6940] VGAM499 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry vein banding virus (SVBV). VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6941] VGAM499 gene, herein designated VGAM GENE, encodes a VGAM499 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM499 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM499 precursor RNA is designated SEQ ID:485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:485 is located at position 4662 relative to the genome of Strawberry vein banding virus (SVBV).

[6942] VGAM499 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6943] An enzyme complex designated DICER COMPLEX, dices the VGAM499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM499 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM499 RNA is designated SEQ ID:3210, and is provided hereinbelow with reference to the sequence listing part.

[6944] VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6945] VGAM499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM499 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6946] The complementary binding of VGAM499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6947] It is appreciated that VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM499 host target genes. The mRNA of each one of this plurality of VGAM499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM499 RNA, herein designated VGAM RNA, and which when bound by VGAM499 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM499 host target proteins.

[6948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM499 gene, herein designated VGAM GENE, on one or more VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6949] It is yet further appreciated that a function of VGAM499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of viral infection by Strawberry vein banding virus (SVBV). Specific functions, and accordingly utilities, of VGAM499 correlate with, and may be deduced from, the identity of the host target genes which VGAM499

binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6950] Nucleotide sequences of the VGAM499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM499 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM499 are further described hereinbelow with reference to Table 1.

[6951] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6952] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 500 (VGAM500) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6953] VGAM500 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM500 was detected is described hereinabove with reference to Figs. 2–8.

[6954] VGAM500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry vein banding virus (SVBV). VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6955] VGAM500 gene, herein designated VGAM GENE, encodes a VGAM500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM500 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM500 precursor RNA is designated SEQ ID:486, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:486 is located at position 4531 relative to the genome of Strawberry vein banding virus (SVBV).

[6956] VGAM500 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6957] An enzyme complex designated DICER COMPLEX, dices the VGAM500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM500 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM500 RNA is designated SEQ ID:3211, and is provided hereinbelow with reference to the sequence listing part.

[6958] VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6959] VGAM500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6960] The complementary binding of VGAM500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6961] It is appreciated that VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM500 host target genes. The mRNA of each one of this plurality of VGAM500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM500 RNA, herein designated VGAM RNA, and which when bound by VGAM500 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM500 host target proteins.

[6962] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM500 gene, herein designated VGAM GENE, on one or more VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6963] It is yet further appreciated that a function of VGAM500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of viral infection by Strawberry vein banding virus (SVBV). Specific functions, and accordingly utilities, of VGAM500 correlate with, and may be deduced from,

the identity of the host target genes which VGAM500 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6964] Nucleotide sequences of the VGAM500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM500 are further described hereinbelow with reference to Table 1.

[6965] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6966] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 501 (VGAM501) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6967] VGAM501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM501 was detected is described hereinabove with reference to Figs. 2–8.

[6968] VGAM501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carrot mottle mimic virus. VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6969] VGAM501 gene, herein designated VGAM GENE, encodes a VGAM501 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM501 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM501 precursor RNA is designated SEQ ID:487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:487 is located at position 2430 relative to the genome of Carrot mottle mimic virus.

[6970] VGAM501 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM501 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6971] An enzyme complex designated DICER COMPLEX, dices the VGAM501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM501 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM501 RNA is designated SEQ ID:3212, and is provided hereinbelow with reference to the sequence listing part.

[6972] VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM501 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6973] VGAM501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6974] The complementary binding of VGAM501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6975] It is appreciated that VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM501 host target genes. The mRNA of each one of this plurality of VGAM501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM501 RNA, herein designated VGAM RNA, and which when bound by VGAM501 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM501 host target proteins.

[6976] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM501 gene, herein designated VGAM GENE, on one or more VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6977] It is yet further appreciated that a function of VGAM501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of viral infection by Carrot mottle mimic virus. Specific functions, and accordingly utilities, of VGAM501

correlate with, and may be deduced from, the identity of the host target genes which VGAM501 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6978] Nucleotide sequences of the VGAM501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM501 are further described hereinbelow with reference to Table 1.

[6979] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6980] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 502 (VGAM502) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[6981] VGAM502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM502 was detected is described hereinabove with reference to Figs. 2–8.

[6982] VGAM502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carrot mottle mimic virus. VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6983] VGAM502 gene, herein designated VGAM GENE, encodes a VGAM502 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM502 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM502 precursor RNA is designated SEQ ID:488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:488 is located at position 2271 relative to the genome of Carrot mottle mimic virus.

[6984] VGAM502 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM502 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6985] An enzyme complex designated DICER COMPLEX, dices the VGAM502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM502 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM502 RNA is designated SEQ ID:3213, and is provided hereinbelow with reference to the sequence listing part.

[6986] VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM502 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6987] VGAM502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM502 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6988] The complementary binding of VGAM502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6989] It is appreciated that VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM502 host target genes. The mRNA of each one of this plurality of VGAM502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM502 RNA, herein designated VGAM RNA, and which when bound by VGAM502 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM502 host target proteins.

[6990] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM502 gene, herein designated VGAM GENE, on one or more VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6991] It is yet further appreciated that a function of VGAM502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM502 include diagnosis, prevention and treatment of viral infection by Carrot mottle mimic virus.

Specific functions, and accordingly utilities, of VGAM502 correlate with, and may be deduced from, the identity of the host target genes which VGAM502 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6992] Nucleotide sequences of the VGAM502 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM502 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM502 are further described hereinbelow with reference to Table 1.

[6993] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM502 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6994] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 503 (VGAM503) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[6995] VGAM503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM503 was detected is described hereinabove with reference to Figs. 2–8.

[6996] VGAM503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6997] VGAM503 gene, herein designated VGAM GENE, encodes a VGAM503 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM503 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM503 precursor RNA is designated SEQ ID:489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:489 is located at position 9956 relative to the genome of Molluscum contagiosum virus.

[6998] VGAM503 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6999] An enzyme complex designated DICER COMPLEX, dices the VGAM503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM503 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM503 RNA is designated SEQ ID:3214, and is provided hereinbelow with reference to the sequence listing part.

[7000] VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7001] VGAM503 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM503 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM503 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7002] The complementary binding of VGAM503 RNA, herein designated VGAM RNA, to host target binding sites on VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM503 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7003] It is appreciated that VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM503 host target genes. The mRNA of each one of this plurality of VGAM503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM503 RNA, herein designated VGAM RNA, and which when bound by VGAM503 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM503 host target proteins.

[7004] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM503 gene, herein designated VGAM GENE, on one or more VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7005] It is yet further appreciated that a function of VGAM503 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM503 include diagnosis, prevention and

treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM503 correlate with, and may be deduced from, the identity of the host target genes which VGAM503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7006] Nucleotide sequences of the VGAM503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM503 are further described hereinbelow with reference to Table 1.

[7007] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7008] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 504 (VGAM504) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7009] VGAM504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM504 was detected is described hereinabove with reference to Figs. 2–8.

[7010] VGAM504 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mollusum contagiosum virus. VGAM504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7011] VGAM504 gene, herein designated VGAM GENE, encodes a VGAM504 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM504 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM504 precursor RNA is designated SEQ ID:490, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:490 is located at position 49770 relative to the genome of Mollusum contagiosum virus.

[7012] VGAM504 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7013] An enzyme complex designated DICER COMPLEX, dices the VGAM504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM504 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM504 RNA is designated SEQ ID:3215, and is provided hereinbelow with reference to the sequence listing part.

[7014] VGAM504 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7015] VGAM504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM504 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7016] The complementary binding of VGAM504 RNA, herein designated VGAM RNA, to host target binding sites on VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7017] It is appreciated that VGAM504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM504 host target genes. The mRNA of each one of this plurality of VGAM504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM504 RNA, herein designated VGAM

RNA, and which when bound by VGAM504 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM504 host target proteins.

[7018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM504 gene, herein designated VGAM GENE, on one or more VGAM504 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7019] It is yet further appreciated that a function of VGAM504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM504 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM504 correlate with, and may be deduced from, the identity of the host target genes which VGAM504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7020] Nucleotide sequences of the VGAM504 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM504 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM504 are further described hereinbelow with reference to Table 1.

[7021] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM504 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7022] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 505 (VGAM505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7023] VGAM505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM505 was detected is described hereinabove with reference to Figs. 2–8.

[7024] VGAM505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7025] VGAM505 gene, herein designated VGAM GENE, encodes a VGAM505 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM505 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM505 precursor RNA is designated SEQ ID:491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:491 is located at position 106639 relative

to the genome of Mollusum contagiosum virus.

[7026] VGAM505 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7027] An enzyme complex designated DICER COMPLEX, dices the VGAM505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM505 RNA is designated SEQ ID:3216, and is provided hereinbelow with reference to the sequence listing part.

[7028] VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7029] VGAM505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM505 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7030] The complementary binding of VGAM505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7031] It is appreciated that VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM505 host target genes. The mRNA of each one of this plurality of VGAM505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM505 RNA, herein designated VGAM RNA, and which when bound by VGAM505 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM505 host target proteins.

[7032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM505 gene, herein designated VGAM GENE, on one or more VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7033] It is yet further appreciated that a function of VGAM505 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM505 correlate with, and may be deduced from, the identity of the host target genes which VGAM505 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7034] Nucleotide sequences of the VGAM505 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM505 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM505 are further described hereinbelow with reference to Table 1.

[7035] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM505 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7036] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 506 (VGAM506) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7037] VGAM506 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM506 was detected is described hereinabove with reference to Figs. 2–8.

[7038] VGAM506 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saguaro cactus virus. VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7039] VGAM506 gene, herein designated VGAM GENE, encodes a VGAM506 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM506 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM506 precursor RNA is designated SEQ ID:492, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:492 is located at position 1711 relative to the genome of Saguaro cactus virus.

[7040] VGAM506 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7041] An enzyme complex designated DICER COMPLEX, dices the VGAM506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM506 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM506 RNA is designated SEQ ID:3217, and is provided hereinbelow with reference to the sequence

listing part.

[7042] VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7043] VGAM506 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM506 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM506 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7044] The complementary binding of VGAM506 RNA, herein designated VGAM RNA, to host target binding sites on VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM506 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7045] It is appreciated that VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM506 host target genes. The mRNA of each one of this plurality of VGAM506 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM506 RNA, herein designated VGAM RNA, and which when bound by VGAM506 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM506 host target proteins.

[7046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM506 gene, herein designated VGAM GENE, on one or more VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7047] It is yet further appreciated that a function of VGAM506 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM506 include diagnosis, prevention and treatment of viral infection by Saguaro cactus virus. Specific functions, and accordingly utilities, of VGAM506 correlate with, and may be deduced from, the identity of the host target genes which VGAM506 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7048] Nucleotide sequences of the VGAM506 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM506 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM506 are further described hereinbelow with reference to Table 1.

[7049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM506 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7050] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 507 (VGAM507) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7051] VGAM507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM507 was detected is described hereinabove with reference to Figs. 2–8.

[7052] VGAM507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saguaro cactus virus. VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7053] VGAM507 gene, herein designated VGAM GENE, encodes a VGAM507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM507 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM507 precursor RNA is designated SEQ ID:493, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:493 is located at position 2130 relative to the genome of Saguaro cactus virus.

[7054] VGAM507 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7055] An enzyme complex designated DICER COMPLEX, dices the VGAM507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM507 RNA is designated SEQ ID:3218, and

is provided hereinbelow with reference to the sequence listing part.

[7056] VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7057] VGAM507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM507 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM507 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7058] The complementary binding of VGAM507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7059] It is appreciated that VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM507 host target genes. The mRNA of each one of this plurality of VGAM507 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM507 RNA, herein designated VGAM RNA, and which when bound by VGAM507 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM507 host target proteins.

[7060] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM507 gene, herein designated VGAM GENE, on one or more VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7061] It is yet further appreciated that a function of VGAM507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM507 include diagnosis, prevention and treatment of viral infection by Saguaro cactus virus. Specific functions, and accordingly utilities, of VGAM507 correlate with, and may be deduced from, the identity of the host target genes which VGAM507 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7062] Nucleotide sequences of the VGAM507 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM507 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM507 are further described hereinbelow with reference to Table 1.

[7063] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM507 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7064] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 508 (VGAM508) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7065] VGAM508 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM508 was detected is described hereinabove with reference to Figs. 2–8.

[7066] VGAM508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saguaro cactus virus. VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7067] VGAM508 gene, herein designated VGAM GENE, encodes a VGAM508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM508 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM508 precursor RNA is

designated SEQ ID:494, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:494 is located at position 1022 relative to the genome of Saguaro cactus virus.

[7068] VGAM508 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7069] An enzyme complex designated DICER COMPLEX, dices the VGAM508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide se-

quence of VGAM508 RNA is designated SEQ ID:3219, and is provided hereinbelow with reference to the sequence listing part.

[7070] VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7071] VGAM508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM508 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7072] The complementary binding of VGAM508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7073] It is appreciated that VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM508 host target genes. The mRNA of

each one of this plurality of VGAM508 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM508 RNA, herein designated VGAM RNA, and which when bound by VGAM508 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM508 host target proteins.

[7074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM508 gene, herein designated VGAM GENE, on one or more VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[7075] It is yet further appreciated that a function of VGAM508 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of viral infection by Saguaro cactus virus. Specific functions, and accordingly utilities, of VGAM508 correlate with, and may be deduced from, the identity of the host target genes which VGAM508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7076] Nucleotide sequences of the VGAM508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM508 are further described hereinbelow with reference to Table 1.

[7077] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM508 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[7078] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 509 (VGAM509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7079] VGAM509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM509 was detected is described hereinabove with reference to Figs. 2–8.

[7080] VGAM509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Papaya ringspot virus. VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7081] VGAM509 gene, herein designated VGAM GENE, encodes a VGAM509 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM509 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM509 precursor RNA is designated SEQ ID:495, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:495 is located at position 7642 relative to the genome of Papaya ringspot virus.

[7082] VGAM509 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7083] An enzyme complex designated DICER COMPLEX, dices the VGAM509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM509 RNA is designated SEQ ID:3220, and is provided hereinbelow with reference to the sequence listing part.

[7084] VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7085] VGAM509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM509 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7086] The complementary binding of VGAM509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7087] It is appreciated that VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM509 host target genes. The mRNA of each one of this plurality of VGAM509 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM509 RNA, herein designated VGAM RNA, and which when bound by VGAM509 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM509 host target proteins.

[7088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM509 gene, herein designated VGAM GENE, on one or more VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[7089] It is yet further appreciated that a function of VGAM509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM509 include diagnosis, prevention and treatment of viral infection by Papaya ringspot virus. Specific functions, and accordingly utilities, of VGAM509 correlate with, and may be deduced from, the identity of the host target genes which VGAM509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7090] Nucleotide sequences of the VGAM509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM509 are further described hereinbelow with reference to Table 1.

[7091] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM509 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7092] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 510 (VGAM510) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7093] VGAM510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM510 was detected is described hereinabove with reference to Figs. 2–8.

[7094] VGAM510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Papaya ringspot virus. VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7095] VGAM510 gene, herein designated VGAM GENE, encodes a VGAM510 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM510 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM510 precursor RNA is designated SEQ ID:496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:496 is located at position 4216 relative to the genome of Papaya ringspot virus.

[7096] VGAM510 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7097] An enzyme complex designated DICER COMPLEX, dices the VGAM510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM510 RNA is designated SEQ ID:3221, and is provided hereinbelow with reference to the sequence listing part.

[7098] VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7099] VGAM510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM510 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7100] The complementary binding of VGAM510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7101] It is appreciated that VGAM510 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM510 host target genes. The mRNA of each one of this plurality of VGAM510 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM510 RNA, herein designated VGAM RNA, and which when bound by VGAM510 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM510 host target proteins.

[7102] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM510 gene, herein designated VGAM GENE, on one or more VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7103] It is yet further appreciated that a function of VGAM510 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of viral infection by Papaya ringspot virus. Specific functions, and accordingly utilities, of VGAM510 correlate with, and may be deduced from, the identity of the host target genes which VGAM510 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7104] Nucleotide sequences of the VGAM510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM510 are further described hereinbelow with reference to Table 1.

[7105] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM510 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7106] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 511 (VGAM511) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7107] VGAM511 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM511 was detected is described hereinabove with reference to Figs. 2–8.

[7108] VGAM511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7109] VGAM511 gene, herein designated VGAM GENE, encodes a VGAM511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM511 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM511 precursor RNA is designated SEQ ID:497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:497 is located at position 1481 relative to the genome of Cucumber green mottle mosaic virus.

[7110] VGAM511 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7111] An enzyme complex designated DICER COMPLEX, dices the VGAM511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM511 RNA is designated SEQ ID:3222, and is provided hereinbelow with reference to the sequence listing part.

[7112] VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7113] VGAM511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM511 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7114] The complementary binding of VGAM511 RNA, herein designated VGAM RNA, to host target binding sites on VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7115] It is appreciated that VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM511 host target genes. The mRNA of each one of this plurality of VGAM511 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM511 RNA, herein designated VGAM RNA, and which when bound by VGAM511 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM511 host target proteins.

[7116] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM511 gene, herein designated VGAM GENE, on one or more VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7117] It is yet further appreciated that a function of VGAM511 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM511 correlate with, and may be deduced from, the identity of the host target genes which VGAM511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7118] Nucleotide sequences of the VGAM511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM511 are further described hereinbelow with reference to Table 1.

[7119] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM511 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7120] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 512 (VGAM512) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7121] VGAM512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM512 was detected is described hereinabove with reference to Figs. 2–8.

[7122] VGAM512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7123] VGAM512 gene, herein designated VGAM GENE, encodes a VGAM512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM512 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM512 precursor RNA is designated SEQ ID:498, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:498 is located at position 2385 relative to the genome of Cucumber green mottle mosaic virus.

[7124] VGAM512 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7125] An enzyme complex designated DICER COMPLEX, dices the VGAM512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM512 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM512 RNA is designated SEQ ID:3223, and is provided hereinbelow with reference to the sequence listing part.

[7126] VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7127] VGAM512 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM512 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM512 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7128] The complementary binding of VGAM512 RNA, herein designated VGAM RNA, to host target binding sites on VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM512 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[7129] It is appreciated that VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM512 host target genes. The mRNA of each one of this plurality of VGAM512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM512 RNA, herein designated VGAM RNA, and which when bound by VGAM512 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM512 host target proteins.

[7130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM512 gene, herein designated VGAM GENE, on one or more VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7131] It is yet further appreciated that a function of VGAM512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM512 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM512 correlate with, and may be deduced from, the identity of the host target genes which VGAM512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7132] Nucleotide sequences of the VGAM512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM512 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM512 are further described hereinbelow with reference to Table 1.

[7133] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7134] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 513 (VGAM513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7135] VGAM513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM513 was detected is described hereinabove with reference to Figs. 2-8.

[7136] VGAM513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7137] VGAM513 gene, herein designated VGAM GENE, encodes a VGAM513 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM513 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM513 precursor RNA is designated SEQ ID:499, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:499 is located at position 2231 relative to the genome of Cucumber green mottle mosaic virus.

[7138] VGAM513 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7139] An enzyme complex designated DICER COMPLEX, dices the VGAM513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM513 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM513 RNA is designated SEQ ID:3224, and is provided hereinbelow with reference to the sequence listing part.

[7140] VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7141] VGAM513 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM513 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM513 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7142] The complementary binding of VGAM513 RNA, herein designated VGAM RNA, to host target binding sites on VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM513 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7143] It is appreciated that VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM513 host target genes. The mRNA of each one of this plurality of VGAM513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM513 RNA, herein designated VGAM RNA, and which when bound by VGAM513 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM513 host target proteins.

[7144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM513 gene, herein designated VGAM GENE, on one or more VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7145] It is yet further appreciated that a function of VGAM513 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM513 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM513 correlate with, and may be deduced from, the identity of the host target genes which VGAM513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7146] Nucleotide sequences of the VGAM513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM513 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM513 are further described hereinbelow with reference to Table 1.

[7147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7148] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 514 (VGAM514) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7149] VGAM514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM514 was detected is described hereinabove with reference to Figs. 2-8.

[7150] VGAM514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7151] VGAM514 gene, herein designated VGAM GENE, encodes a

VGAM514 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM514 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM514 precursor RNA is designated SEQ ID:500, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:500 is located at position 1818 relative to the genome of Cucumber green mottle mosaic virus.

[7152] VGAM514 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7153] An enzyme complex designated DICER COMPLEX, dices the VGAM514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM514 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM514 RNA is designated SEQ ID:3225, and is provided hereinbelow with reference to the sequence listing part.

[7154] VGAM514 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7155] VGAM514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM514 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7156] The complementary binding of VGAM514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7157] It is appreciated that VGAM514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM514 host target genes. The mRNA of each one of this plurality of VGAM514 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM514 RNA, herein designated VGAM

RNA, and which when bound by VGAM514 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM514 host target proteins.

[7158] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM514 gene, herein designated VGAM GENE, on one or more VGAM514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7159] It is yet further appreciated that a function of VGAM514 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM514 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM514 correlate with, and may be deduced from, the identity of the host target genes which VGAM514 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7160] Nucleotide sequences of the VGAM514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM514 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM514 are further described hereinbelow with reference to Table 1.

[7161] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7162] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 515 (VGAM515) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7163] VGAM515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM515 was detected is described hereinabove with reference to Figs. 2–8.

[7164] VGAM515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7165] VGAM515 gene, herein designated VGAM GENE, encodes a VGAM515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM515 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM515 precursor RNA is designated SEQ ID:501, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:501 is located at position 4400 relative to

the genome of Cucumber green mottle mosaic virus.

[7166] VGAM515 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7167] An enzyme complex designated DICER COMPLEX, dices the VGAM515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM515 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM515 RNA is designated SEQ ID:3226, and is provided hereinbelow with reference to the sequence listing part.

[7168] VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7169] VGAM515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM515 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7170] The complementary binding of VGAM515 RNA, herein designated VGAM RNA, to host target binding sites on VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7171] It is appreciated that VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM515 host target genes. The mRNA of each one of this plurality of VGAM515 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM515 RNA, herein designated VGAM RNA, and which when bound by VGAM515 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM515 host target proteins.

[7172] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM515 gene, herein designated VGAM GENE, on one or more VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7173] It is yet further appreciated that a function of VGAM515 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM515 correlate with, and may be deduced from, the identity of the host target genes which VGAM515 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7174] Nucleotide sequences of the VGAM515 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM515 are further described hereinbelow with reference to Table 1.

[7175] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7176] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 516 (VGAM516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7177] VGAM516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM516 was detected is described hereinabove with reference to Figs. 2–8.

[7178] VGAM516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Galinsoga mosaic virus. VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7179] VGAM516 gene, herein designated VGAM GENE, encodes a VGAM516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM516 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM516 precursor RNA is designated SEQ ID:502, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:502 is located at position 2863 relative to the genome of Galinsoga mosaic virus.

[7180] VGAM516 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7181] An enzyme complex designated DICER COMPLEX, dices the VGAM516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM516 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM516 RNA is designated SEQ ID:3227, and is provided hereinbelow with reference to the sequence

listing part.

[7182] VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7183] VGAM516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7184] The complementary binding of VGAM516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7185] It is appreciated that VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM516 host target genes. The mRNA of each one of this plurality of VGAM516 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM516 RNA, herein designated VGAM RNA, and which when bound by VGAM516 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM516 host target proteins.

[7186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM516 gene, herein designated VGAM GENE, on one or more VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7187] It is yet further appreciated that a function of VGAM516 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of viral infection by Galinsoga mosaic virus. Specific functions, and accordingly utilities, of VGAM516 correlate with, and may be deduced from, the identity of the host target genes which VGAM516 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7188] Nucleotide sequences of the VGAM516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM516 are further described hereinbelow with reference to Table 1.

[7189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM516 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7190] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 517 (VGAM517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7191] VGAM517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM517 was detected is described hereinabove with reference to Figs. 2–8.

[7192] VGAM517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Galinsoga mosaic virus. VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7193] VGAM517 gene, herein designated VGAM GENE, encodes a VGAM517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM517 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM517 precursor RNA is designated SEQ ID:503, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:503 is located at position 3248 relative to the genome of Galinsoga mosaic virus.

[7194] VGAM517 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7195] An enzyme complex designated DICER COMPLEX, dices the VGAM517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM517 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM517 RNA is designated SEQ ID:3228, and

is provided hereinbelow with reference to the sequence listing part.

[7196] VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7197] VGAM517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7198] The complementary binding of VGAM517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7199] It is appreciated that VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM517 host target genes. The mRNA of each one of this plurality of VGAM517 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM517 RNA, herein designated VGAM RNA, and which when bound by VGAM517 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM517 host target proteins.

[7200] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM517 gene, herein designated VGAM GENE, on one or more VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7201] It is yet further appreciated that a function of VGAM517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of viral infection by Galinsoga mosaic virus. Specific functions, and accordingly utilities, of VGAM517 correlate with, and may be deduced from, the identity of the host target genes which VGAM517 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7202] Nucleotide sequences of the VGAM517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM517 are further described hereinbelow with reference to Table 1.

[7203] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7204] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 518 (VGAM518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7205] VGAM518 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM518 was detected is described hereinabove with reference to Figs. 2–8.

[7206] VGAM518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7207] VGAM518 gene, herein designated VGAM GENE, encodes a VGAM518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM518 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM518 precursor RNA is

designated SEQ ID:504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:504 is located at position 10108 relative to the genome of Lymphocystis disease virus 1.

[7208] VGAM518 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7209] An enzyme complex designated DICER COMPLEX, dices the VGAM518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide se-

quence of VGAM518 RNA is designated SEQ ID:3229, and is provided hereinbelow with reference to the sequence listing part.

[7210] VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7211] VGAM518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7212] The complementary binding of VGAM518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7213] It is appreciated that VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM518 host target genes. The mRNA of

each one of this plurality of VGAM518 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM518 RNA, herein designated VGAM RNA, and which when bound by VGAM518 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM518 host target proteins.

[7214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM518 gene, herein designated VGAM GENE, on one or more VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[7215] It is yet further appreciated that a function of VGAM518 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM518 correlate with, and may be deduced from, the identity of the host target genes which VGAM518 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7216] Nucleotide sequences of the VGAM518 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM518 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM518 are further described hereinbelow with reference to Table 1.

[7217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM518 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[7218] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 519 (VGAM519) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7219] VGAM519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM519 was detected is described hereinabove with reference to Figs. 2–8.

[7220] VGAM519 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7221] VGAM519 gene, herein designated VGAM GENE, encodes a VGAM519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM519 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM519 precursor RNA is designated SEQ ID:505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:505 is located at position 70833 relative to the genome of Lymphocystis disease virus 1.

[7222] VGAM519 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7223] An enzyme complex designated DICER COMPLEX, dices the VGAM519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM519 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM519 RNA is designated SEQ ID:3230, and is provided hereinbelow with reference to the sequence listing part.

[7224] VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7225] VGAM519 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM519 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7226] The complementary binding of VGAM519 RNA, herein designated VGAM RNA, to host target binding sites on VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7227] It is appreciated that VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM519 host target genes. The mRNA of each one of this plurality of VGAM519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM519 RNA, herein designated VGAM RNA, and which when bound by VGAM519 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM519 host target proteins.

[7228] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM519 gene, herein designated VGAM GENE, on one or more VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[7229] It is yet further appreciated that a function of VGAM519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM519 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM519 correlate with, and may be deduced from, the identity of the host target genes which VGAM519 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7230] Nucleotide sequences of the VGAM519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM519 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM519 are further described hereinbelow with reference to Table 1.

[7231] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7232] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 520 (VGAM520) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7233] VGAM520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM520 was detected is described hereinabove with reference to Figs. 2–8.

[7234] VGAM520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7235] VGAM520 gene, herein designated VGAM GENE, encodes a VGAM520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM520 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM520 precursor RNA is designated SEQ ID:506, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:506 is located at position 71198 relative to the genome of Lymphocystis disease virus 1.

[7236] VGAM520 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7237] An enzyme complex designated DICER COMPLEX, dices the VGAM520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM520 RNA is designated SEQ ID:3231, and is provided hereinbelow with reference to the sequence listing part.

[7238] VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7239] VGAM520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM520 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM520 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7240] The complementary binding of VGAM520 RNA, herein designated VGAM RNA, to host target binding sites on VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7241] It is appreciated that VGAM520 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM520 host target genes. The mRNA of each one of this plurality of VGAM520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM520 RNA, herein designated VGAM RNA, and which when bound by VGAM520 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM520 host target proteins.

[7242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM520 gene, herein designated VGAM GENE, on one or more VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7243] It is yet further appreciated that a function of VGAM520 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM520 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM520 correlate with, and may be deduced from, the identity of the host target genes which VGAM520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7244] Nucleotide sequences of the VGAM520 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM520 are further described hereinbelow with reference to Table 1.

[7245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7246] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 521 (VGAM521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7247] VGAM521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM521 was detected is described hereinabove with reference to Figs. 2–8.

[7248] VGAM521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7249] VGAM521 gene, herein designated VGAM GENE, encodes a VGAM521 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM521 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM521 precursor RNA is designated SEQ ID:507, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:507 is located at position 75552 relative to the genome of Lymphocystis disease virus 1.

[7250] VGAM521 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7251] An enzyme complex designated DICER COMPLEX, dices the VGAM521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM521 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM521 RNA is designated SEQ ID:3232, and is provided hereinbelow with reference to the sequence listing part.

[7252] VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7253] VGAM521 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM521 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7254] The complementary binding of VGAM521 RNA, herein designated VGAM RNA, to host target binding sites on VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM521 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7255] It is appreciated that VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM521 host target genes. The mRNA of each one of this plurality of VGAM521 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM521 RNA, herein designated VGAM RNA, and which when bound by VGAM521 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM521 host target proteins.

[7256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM521 gene, herein designated VGAM GENE, on one or more VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7257] It is yet further appreciated that a function of VGAM521 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM521 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM521 correlate with, and may be deduced from, the identity of the host target genes which VGAM521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7258] Nucleotide sequences of the VGAM521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM521 are further described hereinbelow with reference to Table 1.

[7259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7260] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 522 (VGAM522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7261] VGAM522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM522 was detected is described hereinabove with reference to Figs. 2–8.

[7262] VGAM522 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7263] VGAM522 gene, herein designated VGAM GENE, encodes a VGAM522 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM522 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM522 precursor RNA is designated SEQ ID:508, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:508 is located at position 76141 relative to the genome of Lymphocystis disease virus 1.

[7264] VGAM522 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7265] An enzyme complex designated DICER COMPLEX, dices the VGAM522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM522 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM522 RNA is designated SEQ ID:3233, and is provided hereinbelow with reference to the sequence listing part.

[7266] VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7267] VGAM522 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM522 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM522 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7268] The complementary binding of VGAM522 RNA, herein designated VGAM RNA, to host target binding sites on VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[7269] It is appreciated that VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM522 host target genes. The mRNA of each one of this plurality of VGAM522 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM522 RNA, herein designated VGAM RNA, and which when bound by VGAM522 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM522 host target proteins.

[7270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM522 gene, herein designated VGAM GENE, on one or more VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7271] It is yet further appreciated that a function of VGAM522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM522 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM522 correlate with, and may be deduced from, the identity of the host target genes which VGAM522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7272] Nucleotide sequences of the VGAM522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM522 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM522 are further described hereinbelow with reference to Table 1.

[7273] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM522 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7274] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 523 (VGAM523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7275] VGAM523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM523 was detected is described hereinabove with reference to Figs. 2-8.

[7276] VGAM523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7277] VGAM523 gene, herein designated VGAM GENE, encodes a VGAM523 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM523 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM523 precursor RNA is designated SEQ ID:509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:509 is located at position 44554 relative to the genome of murid herpesvirus 4.

[7278] VGAM523 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7279] An enzyme complex designated DICER COMPLEX, dices the VGAM523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM523 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM523 RNA is designated SEQ ID:3234, and is provided hereinbelow with reference to the sequence listing part.

[7280] VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7281] VGAM523 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM523 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM523 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7282] The complementary binding of VGAM523 RNA, herein designated VGAM RNA, to host target binding sites on VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM523 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7283] It is appreciated that VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM523 host target genes. The mRNA of each one of this plurality of VGAM523 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM523 RNA, herein designated VGAM RNA, and which when bound by VGAM523 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM523 host target proteins.

[7284] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM523 gene, herein designated VGAM GENE, on one or more VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7285] It is yet further appreciated that a function of VGAM523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM523 correlate with, and may be deduced from, the identity of the host target genes which VGAM523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7286] Nucleotide sequences of the VGAM523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM523 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM523 are further described hereinbelow with reference to Table 1.

[7287] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM523 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7288] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 524 (VGAM524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7289] VGAM524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM524 was detected is described hereinabove with reference to Figs. 2-8.

[7290] VGAM524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7291] VGAM524 gene, herein designated VGAM GENE, encodes a

VGAM524 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM524 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM524 precursor RNA is designated SEQ ID:510, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:510 is located at position 45166 relative to the genome of murid herpesvirus 4.

[7292] VGAM524 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7293] An enzyme complex designated DICER COMPLEX, dices the VGAM524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM524 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM524 RNA is designated SEQ ID:3235, and is provided hereinbelow with reference to the sequence listing part.

[7294] VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7295] VGAM524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM524 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7296] The complementary binding of VGAM524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7297] It is appreciated that VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM524 host target genes. The mRNA of each one of this plurality of VGAM524 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM524 RNA, herein designated VGAM RNA, and which when bound by VGAM524 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM524 host target proteins.

[7298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM524 gene, herein designated VGAM GENE, on one or more VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7299] It is yet further appreciated that a function of VGAM524 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM524 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM524 correlate with, and may be deduced from, the identity of the host target genes which VGAM524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7300] Nucleotide sequences of the VGAM524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM524 are further de-

scribed hereinbelow with reference to Table 1.

[7301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM524 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7302] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 525 (VGAM525) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7303] VGAM525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM525 was detected is described hereinabove with reference to Figs. 2-8.

[7304] VGAM525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7305] VGAM525 gene, herein designated VGAM GENE, encodes a VGAM525 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM525 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM525 precursor RNA is designated SEQ ID:511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:511 is located at position 53388 relative to the genome of murid herpesvirus 4.

[7306] VGAM525 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7307] An enzyme complex designated DICER COMPLEX, dices the VGAM525 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM525 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM525 RNA is designated SEQ ID:3236, and is provided hereinbelow with reference to the sequence listing part.

[7308] VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7309] VGAM525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7310] The complementary binding of VGAM525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM525 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7311] It is appreciated that VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM525 host target genes. The mRNA of each one of this plurality of VGAM525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM525 RNA, herein designated VGAM RNA, and which when bound by VGAM525 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM525 host target proteins.

[7312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM525 gene, herein designated VGAM GENE, on one or more VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7313] It is yet further appreciated that a function of VGAM525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM525 correlate with, and may be deduced from, the identity of the host target genes which VGAM525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7314] Nucleotide sequences of the VGAM525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM525 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM525 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM525 are further described hereinbelow with reference to Table 1.

[7315] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7316] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 526 (VGAM526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7317] VGAM526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM526 was detected is described hereinabove with reference to Figs. 2-8.

[7318] VGAM526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[7319] VGAM526 gene, herein designated VGAM GENE, encodes a VGAM526 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM526 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM526 precursor RNA is designated SEQ ID:512, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:512 is located at position 54037 relative to the genome of murid herpesvirus 4.

[7320] VGAM526 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7321] An enzyme complex designated DICER COMPLEX, dices

the VGAM526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM526 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM526 RNA is designated SEQ ID:3237, and is provided hereinbelow with reference to the sequence listing part.

[7322] VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7323] VGAM526 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM526 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM526 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7324] The complementary binding of VGAM526 RNA, herein designated VGAM RNA, to host target binding sites on VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM526 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7325] It is appreciated that VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM526 host target genes. The mRNA of each one of this plurality of VGAM526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM526 RNA, herein designated VGAM RNA, and which when bound by VGAM526 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM526 host target proteins.

[7326] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM526 gene, herein designated VGAM GENE, on one or more VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7327] It is yet further appreciated that a function of VGAM526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM526 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM526 correlate with, and may be deduced from, the identity of the host target genes which VGAM526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7328] Nucleotide sequences of the VGAM526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM526 are further described hereinbelow with reference to Table 1.

[7329] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM526 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7330] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 527 (VGAM527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7331] VGAM527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM527 was detected is described hereinabove with reference to Figs. 2-8.

[7332] VGAM527 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM527 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[7333] VGAM527 gene, herein designated VGAM GENE, encodes a VGAM527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM527 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM527 precursor RNA is designated SEQ ID:513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:513 is located at position 83822 relative to the genome of murid herpesvirus 4.

[7334] VGAM527 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [7335] An enzyme complex designated DICER COMPLEX, dices the VGAM527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM527 RNA is designated SEQ ID:3238, and is provided hereinbelow with reference to the sequence listing part.
- [7336] VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [7337] VGAM527 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM527 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM527 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7338] The complementary binding of VGAM527 RNA, herein designated VGAM RNA, to host target binding sites on VGAM527 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7339] It is appreciated that VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM527 host target genes. The mRNA of each one of this plurality of VGAM527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM527 RNA, herein designated VGAM RNA, and which when bound by VGAM527 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM527 host target proteins.

[7340] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM527 gene, herein designated VGAM GENE, on one or more VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7341] It is yet further appreciated that a function of VGAM527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM527 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM527 correlate with, and may be deduced from, the identity of the host target genes which VGAM527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7342] Nucleotide sequences of the VGAM527 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM527 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM527 are further described hereinbelow with reference to Table 1.

[7343] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7344] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 528 (VGAM528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7345] VGAM528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM528 was detected is described hereinabove with reference to Figs. 2-8.

[7346] VGAM528 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4.

VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7347] VGAM528 gene, herein designated VGAM GENE, encodes a VGAM528 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM528 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM528 precursor RNA is designated SEQ ID:514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:514 is located at position 97660 relative to the genome of murid herpesvirus 4.

[7348] VGAM528 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[7349] An enzyme complex designated DICER COMPLEX, dices the VGAM528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM528 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM528 RNA is designated SEQ ID:3239, and is provided hereinbelow with reference to the sequence listing part.

[7350] VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7351] VGAM528 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM528 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM528 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7352] The complementary binding of VGAM528 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7353] It is appreciated that VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM528 host target genes. The mRNA of each one of this plurality of VGAM528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM528 RNA, herein designated VGAM RNA, and which when bound by VGAM528 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM528 host target proteins.

[7354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM528 gene, herein designated VGAM GENE, on one or more VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7355] It is yet further appreciated that a function of VGAM528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM528 correlate with, and may be deduced from, the identity of the host target genes which VGAM528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7356] Nucleotide sequences of the VGAM528 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM528 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM528 are further described hereinbelow with reference to Table 1.

[7357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM528 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7358] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 529 (VGAM529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7359] VGAM529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM529 was detected is described hereinabove with reference to Figs. 2-8.

[7360] VGAM529 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of murid herpesvirus 4. VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7361] VGAM529 gene, herein designated VGAM GENE, encodes a VGAM529 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM529 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM529 precursor RNA is designated SEQ ID:515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:515 is located at position 102688 relative to the genome of murid herpesvirus 4.

[7362] VGAM529 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7363] An enzyme complex designated DICER COMPLEX, dices the VGAM529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM529 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM529 RNA is designated SEQ ID:3240, and is provided hereinbelow with reference to the sequence listing part.

[7364] VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7365] VGAM529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7366] The complementary binding of VGAM529 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7367] It is appreciated that VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM529 host target genes. The mRNA of each one of this plurality of VGAM529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM529 RNA, herein designated VGAM RNA, and which when bound by VGAM529 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM529 host target proteins.

[7368] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM529 gene, herein designated VGAM GENE, on one or more VGAM529 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7369] It is yet further appreciated that a function of VGAM529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM529 correlate with, and may be deduced from, the identity of the host target genes which VGAM529 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7370] Nucleotide sequences of the VGAM529 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM529 are further described hereinbelow with reference to Table 1.

[7371] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7372] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 530 (VGAM530) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7373] VGAM530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM530 was detected is described hereinabove with reference to Figs. 2-8.

[7374] VGAM530 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Common chimpanzee papillomavirus 1. VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7375] VGAM530 gene, herein designated VGAM GENE, encodes a VGAM530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM530 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM530 precursor RNA is designated SEQ ID:516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:516 is located at position 2882 relative to the genome of Common chimpanzee papillomavirus 1.

[7376] VGAM530 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7377] An enzyme complex designated DICER COMPLEX, dices the VGAM530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM530 RNA is designated SEQ ID:3241, and is provided hereinbelow with reference to the sequence listing part.

[7378] VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[7379] VGAM530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7380] The complementary binding of VGAM530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7381] It is appreciated that VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM530 host target genes. The mRNA of each one of this plurality of VGAM530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM530 RNA, herein designated VGAM RNA, and which when bound by VGAM530 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM530 host target proteins.

[7382] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM530 gene, herein designated VGAM GENE, on one or

more VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7383] It is yet further appreciated that a function of VGAM530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of viral infection by Common chimpanzee papillomavirus 1. Specific functions, and accordingly utilities, of VGAM530 correlate with, and may be deduced from, the identity of the host target genes which VGAM530 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7384] Nucleotide sequences of the VGAM530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM530 are further described hereinbelow with reference to Table 1.

[7385] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7386] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 531 (VGAM531) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7387] VGAM531 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM531 was detected is described

hereinabove with reference to Figs. 2–8.

[7388] VGAM531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7389] VGAM531 gene, herein designated VGAM GENE, encodes a VGAM531 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM531 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM531 precursor RNA is designated SEQ ID:517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:517 is located at position 130187 relative to the genome of Equine herpesvirus 4.

[7390] VGAM531 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7391] An enzyme complex designated DICER COMPLEX, dices the VGAM531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM531 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM531 RNA is designated SEQ ID:3242, and is provided hereinbelow with reference to the sequence listing part.

[7392] VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7393] VGAM531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[7394] The complementary binding of VGAM531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM531 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7395] It is appreciated that VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM531 host target genes. The mRNA of each one of this plurality of VGAM531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM531 RNA, herein designated VGAM RNA, and which when bound by VGAM531 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM531 host target proteins.

[7396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM531 gene, herein designated VGAM GENE, on one or more VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7397] It is yet further appreciated that a function of VGAM531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM531 correlate with, and may be deduced from, the identity of the host target genes which VGAM531 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[7398] Nucleotide sequences of the VGAM531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM531 are further described hereinbelow with reference to Table 1.

[7399] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM531 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7400] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 532 (VGAM532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7401] VGAM532 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM532 was detected is described hereinabove with reference to Figs. 2–8.

[7402] VGAM532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7403] VGAM532 gene, herein designated VGAM GENE, encodes a VGAM532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM532 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM532 precursor RNA is designated SEQ ID:518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:518 is located at position 27967 relative to the genome of Murine hepatitis virus.

[7404] VGAM532 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7405] An enzyme complex designated DICER COMPLEX, dices the VGAM532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM532 RNA is designated SEQ ID:3243, and is provided hereinbelow with reference to the sequence listing part.

[7406] VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7407] VGAM532 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7408] The complementary binding of VGAM532 RNA, herein designated VGAM RNA, to host target binding sites on VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7409] It is appreciated that VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM532 host target genes. The mRNA of each one of this plurality of VGAM532 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM532 RNA, herein designated VGAM RNA, and which when bound by VGAM532 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM532 host target proteins.

[7410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM532 gene, herein designated VGAM GENE, on one or more VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7411] It is yet further appreciated that a function of VGAM532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM532 correlate with, and may be deduced from, the identity of the host target genes which VGAM532 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[7412] Nucleotide sequences of the VGAM532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM532 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM532 are further described hereinbelow with reference to Table 1.

[7413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7414] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 533 (VGAM533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7415] VGAM533 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM533 was detected is described hereinabove with reference to Figs. 2–8.

[7416] VGAM533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip vein-clearing virus. VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7417] VGAM533 gene, herein designated VGAM GENE, encodes a VGAM533 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM533 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM533 precursor RNA is designated SEQ ID:519, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:519 is located at position 4883 relative to the genome of Turnip vein-clearing virus.

[7418] VGAM533 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7419] An enzyme complex designated DICER COMPLEX, dices the VGAM533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM533 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM533 RNA is designated SEQ ID:3244, and is provided hereinbelow with reference to the sequence listing part.

[7420] VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7421] VGAM533 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7422] The complementary binding of VGAM533 RNA, herein designated VGAM RNA, to host target binding sites on VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7423] It is appreciated that VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM533 host target genes. The mRNA of each one of this plurality of VGAM533 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM533 RNA, herein designated VGAM RNA, and which when bound by VGAM533 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM533 host target proteins.

[7424] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM533 gene, herein designated VGAM GENE, on one or more VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7425] It is yet further appreciated that a function of VGAM533 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of viral infection by Turnip vein-clearing virus. Specific functions, and accordingly utilities, of VGAM533 correlate with, and may be deduced from, the identity of

the host target genes which VGAM533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7426] Nucleotide sequences of the VGAM533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM533 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM533 are further described hereinbelow with reference to Table 1.

[7427] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7428] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 534 (VGAM534) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7429] VGAM534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM534 was detected is described hereinabove with reference to Figs. 2–8.

[7430] VGAM534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Orgyia pseudotsugata single capsid nuclear polyhedrosis virus. VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7431] VGAM534 gene, herein designated VGAM GENE, encodes a VGAM534 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM534 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM534 precursor RNA is designated SEQ ID:520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:520 is located at position 23857 relative to the genome of Orgyia pseudotsugata single capsid nuclear polyhedrosis virus.

[7432] VGAM534 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM534 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7433] An enzyme complex designated DICER COMPLEX, dices the VGAM534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM534 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM534 RNA is designated SEQ ID:3245, and is provided hereinbelow with reference to the sequence listing part.

[7434] VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM534 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7435] VGAM534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM534 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7436] The complementary binding of VGAM534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7437] It is appreciated that VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM534 host target genes. The mRNA of each one of this plurality of VGAM534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM534 RNA, herein designated VGAM RNA, and which when bound by VGAM534 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM534 host target proteins.

[7438] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM534 gene, herein designated VGAM GENE, on one or more VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7439] It is yet further appreciated that a function of VGAM534 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of viral infection by *Orgyia pseudotsugata* sin-

gle capsid nuclear polyhedrosis virus. Specific functions, and accordingly utilities, of VGAM534 correlate with, and may be deduced from, the identity of the host target genes which VGAM534 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7440] Nucleotide sequences of the VGAM534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM534 are further described hereinbelow with reference to Table 1.

[7441] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM534 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7442] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 535 (VGAM535) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7443] VGAM535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM535 was detected is described hereinabove with reference to Figs. 2–8.

[7444] VGAM535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra virus. VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7445] VGAM535 gene, herein designated VGAM GENE, encodes a VGAM535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM535 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM535 precursor RNA is designated SEQ ID:521, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:521 is located at position 9666 relative to the genome of Hendra virus.

[7446] VGAM535 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7447] An enzyme complex designated DICER COMPLEX, dices the VGAM535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM535 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM535 RNA is designated SEQ ID:3246, and is provided hereinbelow with reference to the sequence listing part.

[7448] VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7449] VGAM535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM535 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM535 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7450] The complementary binding of VGAM535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM535 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7451] It is appreciated that VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM535 host target genes. The mRNA of each one of this plurality of VGAM535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM535 RNA, herein designated VGAM RNA, and which when bound by VGAM535 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM535 host target proteins.

[7452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM535 gene, herein designated VGAM GENE, on one or more VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7453] It is yet further appreciated that a function of VGAM535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM535 include diagnosis, prevention and

treatment of viral infection by Hendra virus. Specific functions, and accordingly utilities, of VGAM535 correlate with, and may be deduced from, the identity of the host target genes which VGAM535 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7454] Nucleotide sequences of the VGAM535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM535 are further described hereinbelow with reference to Table 1.

[7455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7456] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 536 (VGAM536) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7457] VGAM536 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM536 was detected is described hereinabove with reference to Figs. 2–8.

[7458] VGAM536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7459] VGAM536 gene, herein designated VGAM GENE, encodes a VGAM536 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM536 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM536 precursor RNA is designated SEQ ID:522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:522 is located at position 103974 relative to the genome of Ateline herpesvirus 3.

[7460] VGAM536 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7461] An enzyme complex designated DICER COMPLEX, dices the VGAM536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM536 RNA is designated SEQ ID:3247, and is provided hereinbelow with reference to the sequence listing part.

[7462] VGAM536 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7463] VGAM536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM536 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM536 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7464] The complementary binding of VGAM536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7465] It is appreciated that VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM536 host target genes. The mRNA of each one of this plurality of VGAM536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM536 RNA, herein designated VGAM

RNA, and which when bound by VGAM536 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM536 host target proteins.

[7466] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM536 gene, herein designated VGAM GENE, on one or more VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7467] It is yet further appreciated that a function of VGAM536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM536 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM536 correlate with, and may be deduced from, the identity of the host target genes which VGAM536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7468] Nucleotide sequences of the VGAM536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM536 are further described hereinbelow with reference to Table 1.

[7469] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7470] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 537 (VGAM537) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7471] VGAM537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM537 was detected is described hereinabove with reference to Figs. 2–8.

[7472] VGAM537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7473] VGAM537 gene, herein designated VGAM GENE, encodes a VGAM537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM537 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM537 precursor RNA is designated SEQ ID:523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:523 is located at position 103754 relative

to the genome of Ateline herpesvirus 3.

[7474] VGAM537 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7475] An enzyme complex designated DICER COMPLEX, dices the VGAM537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM537 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM537 RNA is designated SEQ ID:3248, and is provided hereinbelow with reference to the sequence listing part.

[7476] VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7477] VGAM537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM537 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM537 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7478] The complementary binding of VGAM537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7479] It is appreciated that VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM537 host target genes. The mRNA of each one of this plurality of VGAM537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM537 RNA, herein designated VGAM RNA, and which when bound by VGAM537 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM537 host target proteins.

[7480] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM537 gene, herein designated VGAM GENE, on one or more VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7481] It is yet further appreciated that a function of VGAM537 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM537 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM537 correlate with, and may be deduced from, the identity of the host target genes which VGAM537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7482] Nucleotide sequences of the VGAM537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM537 are further described hereinbelow with reference to Table 1.

[7483] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7484] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 538 (VGAM538) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7485] VGAM538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM538 was detected is described hereinabove with reference to Figs. 2–8.

[7486] VGAM538 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7487] VGAM538 gene, herein designated VGAM GENE, encodes a VGAM538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM538 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM538 precursor RNA is designated SEQ ID:524, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:524 is located at position 65909 relative to the genome of Ateline herpesvirus 3.

[7488] VGAM538 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7489] An enzyme complex designated DICER COMPLEX, dices the VGAM538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM538 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM538 RNA is designated SEQ ID:3249, and is provided hereinbelow with reference to the sequence

listing part.

[7490] VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7491] VGAM538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7492] The complementary binding of VGAM538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7493] It is appreciated that VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM538 host target genes. The mRNA of each one of this plurality of VGAM538 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM538 RNA, herein designated VGAM RNA, and which when bound by VGAM538 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM538 host target proteins.

[7494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM538 gene, herein designated VGAM GENE, on one or more VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7495] It is yet further appreciated that a function of VGAM538 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM538 correlate with, and may be deduced from, the identity of the host target genes which VGAM538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7496] Nucleotide sequences of the VGAM538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM538 are further described hereinbelow with reference to Table 1.

[7497] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7498] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 539 (VGAM539) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7499] VGAM539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM539 was detected is described hereinabove with reference to Figs. 2–8.

[7500] VGAM539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7501] VGAM539 gene, herein designated VGAM GENE, encodes a VGAM539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM539 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM539 precursor RNA is designated SEQ ID:525, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:525 is located at position 10613 relative to the genome of Bovine respiratory syncytial virus.

[7502] VGAM539 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7503] An enzyme complex designated DICER COMPLEX, dices the VGAM539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM539 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM539 RNA is designated SEQ ID:3250, and

is provided hereinbelow with reference to the sequence listing part.

[7504] VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7505] VGAM539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM539 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM539 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7506] The complementary binding of VGAM539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7507] It is appreciated that VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM539 host target genes. The mRNA of each one of this plurality of VGAM539 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM539 RNA, herein designated VGAM RNA, and which when bound by VGAM539 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM539 host target proteins.

[7508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM539 gene, herein designated VGAM GENE, on one or more VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7509] It is yet further appreciated that a function of VGAM539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM539 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM539 correlate with, and may be deduced from, the identity of the host target genes which VGAM539 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7510] Nucleotide sequences of the VGAM539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM539 are further described hereinbelow with reference to Table 1.

[7511] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7512] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 540 (VGAM540) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7513] VGAM540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM540 was detected is described hereinabove with reference to Figs. 2–8.

[7514] VGAM540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7515] VGAM540 gene, herein designated VGAM GENE, encodes a VGAM540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM540 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM540 precursor RNA is

designated SEQ ID:526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:526 is located at position 14011 relative to the genome of Bovine respiratory syncytial virus.

[7516] VGAM540 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7517] An enzyme complex designated DICER COMPLEX, dices the VGAM540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM540 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide se-

quence of VGAM540 RNA is designated SEQ ID:3251, and is provided hereinbelow with reference to the sequence listing part.

[7518] VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7519] VGAM540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM540 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM540 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7520] The complementary binding of VGAM540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7521] It is appreciated that VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM540 host target genes. The mRNA of

each one of this plurality of VGAM540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM540 RNA, herein designated VGAM RNA, and which when bound by VGAM540 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM540 host target proteins.

[7522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM540 gene, herein designated VGAM GENE, on one or more VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[7523] It is yet further appreciated that a function of VGAM540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM540 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM540 correlate with, and may be deduced from, the identity of the host target genes which VGAM540 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7524] Nucleotide sequences of the VGAM540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM540 are further described hereinbelow with reference to Table 1.

[7525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM540 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[7526] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 541 (VGAM541) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7527] VGAM541 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM541 was detected is described hereinabove with reference to Figs. 2–8.

[7528] VGAM541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7529] VGAM541 gene, herein designated VGAM GENE, encodes a VGAM541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM541 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM541 precursor RNA is designated SEQ ID:527, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:527 is located at position 14726 relative to the genome of Bovine respiratory syncytial virus.

[7530] VGAM541 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7531] An enzyme complex designated DICER COMPLEX, dices the VGAM541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM541 RNA is designated SEQ ID:3252, and is provided hereinbelow with reference to the sequence listing part.

[7532] VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7533] VGAM541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM541 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM541 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7534] The complementary binding of VGAM541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7535] It is appreciated that VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM541 host target genes. The mRNA of each one of this plurality of VGAM541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM541 RNA, herein designated VGAM RNA, and which when bound by VGAM541 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM541 host target proteins.

[7536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM541 gene, herein designated VGAM GENE, on one or more VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[7537] It is yet further appreciated that a function of VGAM541 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM541 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM541 correlate with, and may be deduced from, the identity of the host target genes which VGAM541 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7538] Nucleotide sequences of the VGAM541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM541 are further described hereinbelow with reference to Table 1.

[7539] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM541 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7540] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 542 (VGAM542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7541] VGAM542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM542 was detected is described hereinabove with reference to Figs. 2–8.

[7542] VGAM542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7543] VGAM542 gene, herein designated VGAM GENE, encodes a VGAM542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM542 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM542 precursor RNA is designated SEQ ID:528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:528 is located at position 229631 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[7544] VGAM542 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7545] An enzyme complex designated DICER COMPLEX, dices the VGAM542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM542 RNA is designated SEQ ID:3253, and is provided hereinbelow with reference to the sequence listing part.

[7546] VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7547] VGAM542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM542 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7548] The complementary binding of VGAM542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7549] It is appreciated that VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM542 host target genes. The mRNA of each one of this plurality of VGAM542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM542 RNA, herein designated VGAM RNA, and which when bound by VGAM542 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM542 host target proteins.

[7550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM542 gene, herein designated VGAM GENE, on one or more VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7551] It is yet further appreciated that a function of VGAM542 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM542 correlate with, and may be deduced from, the identity of the host target genes which VGAM542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7552] Nucleotide sequences of the VGAM542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM542 are further described hereinbelow with reference to Table 1.

[7553] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM542 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7554] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 543 (VGAM543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7555] VGAM543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM543 was detected is described hereinabove with reference to Figs. 2–8.

[7556] VGAM543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7557] VGAM543 gene, herein designated VGAM GENE, encodes a VGAM543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM543 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM543 precursor RNA is designated SEQ ID:529, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:529 is located at position 179507 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[7558] VGAM543 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7559] An enzyme complex designated DICER COMPLEX, dices the VGAM543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM543 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM543 RNA is designated SEQ ID:3254, and is provided hereinbelow with reference to the sequence listing part.

[7560] VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7561] VGAM543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM543 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7562] The complementary binding of VGAM543 RNA, herein designated VGAM RNA, to host target binding sites on VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM543 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7563] It is appreciated that VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM543 host target genes. The mRNA of each one of this plurality of VGAM543 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM543 RNA, herein designated VGAM RNA, and which when bound by VGAM543 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM543 host target proteins.

[7564] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM543 gene, herein designated VGAM GENE, on one or more VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7565] It is yet further appreciated that a function of VGAM543 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM543 correlate with, and may be deduced from, the identity of the host target genes which VGAM543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7566] Nucleotide sequences of the VGAM543 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM543 are further described hereinbelow with reference to Table 1.

[7567] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM543 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7568] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 544 (VGAM544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7569] VGAM544 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM544 was detected is described hereinabove with reference to Figs. 2-8.

[7570] VGAM544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7571] VGAM544 gene, herein designated VGAM GENE, encodes a

VGAM544 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM544 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM544 precursor RNA is designated SEQ ID:530, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:530 is located at position 22231 relative to the genome of infectious spleen and kidney necrosis virus.

[7572] VGAM544 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7573] An enzyme complex designated DICER COMPLEX, dices the VGAM544 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM544 RNA is designated SEQ ID:3255, and is provided hereinbelow with reference to the sequence listing part.

[7574] VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7575] VGAM544 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM544 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7576] The complementary binding of VGAM544 RNA, herein designated VGAM RNA, to host target binding sites on VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM544 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7577] It is appreciated that VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM544 host target genes. The mRNA of each one of this plurality of VGAM544 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM544 RNA, herein designated VGAM RNA, and which when bound by VGAM544 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM544 host target proteins.

[7578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM544 gene, herein designated VGAM GENE, on one or more VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7579] It is yet further appreciated that a function of VGAM544 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM544 correlate with, and may be deduced from, the identity of the host target genes which VGAM544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7580] Nucleotide sequences of the VGAM544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM544 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM544 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM544 are further described hereinbelow with reference to Table 1.

[7581] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM544 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7582] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 545 (VGAM545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7583] VGAM545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM545 was detected is described hereinabove with reference to Figs. 2-8.

[7584] VGAM545 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

- [7585] VGAM545 gene, herein designated VGAM GENE, encodes a VGAM545 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM545 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM545 precursor RNA is designated SEQ ID:531, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:531 is located at position 205892 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.
- [7586] VGAM545 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7587] An enzyme complex designated DICER COMPLEX, dices the VGAM545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM545 RNA is designated SEQ ID:3256, and is provided hereinbelow with reference to the sequence listing part.

[7588] VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7589] VGAM545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM545 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7590] The complementary binding of VGAM545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM545 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7591] It is appreciated that VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM545 host target genes. The mRNA of each one of this plurality of VGAM545 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM545 RNA, herein designated VGAM RNA, and which when bound by VGAM545 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM545 host target proteins.

[7592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM545 gene, herein designated VGAM GENE, on one or more VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7593] It is yet further appreciated that a function of VGAM545 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM545 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM545 correlate with, and may be deduced from, the identity of the host target genes which VGAM545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7594] Nucleotide sequences of the VGAM545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM545 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM545 are further described hereinbelow with reference to Table 1.

[7595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM545 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7596] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 546 (VGAM546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7597] VGAM546 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM546 was detected is described hereinabove with reference to Figs. 2-8.

[7598] VGAM546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut stunt virus.

VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7599] VGAM546 gene, herein designated VGAM GENE, encodes a VGAM546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM546 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM546 precursor RNA is designated SEQ ID:532, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:532 is located at position 1857 relative to the genome of Peanut stunt virus.

[7600] VGAM546 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[7601] An enzyme complex designated DICER COMPLEX, dices the VGAM546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM546 RNA is designated SEQ ID:3257, and is provided hereinbelow with reference to the sequence listing part.

[7602] VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7603] VGAM546 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM546 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7604] The complementary binding of VGAM546 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7605] It is appreciated that VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM546 host target genes. The mRNA of each one of this plurality of VGAM546 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM546 RNA, herein designated VGAM RNA, and which when bound by VGAM546 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM546 host target proteins.

[7606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM546 gene, herein designated VGAM GENE, on one or more VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7607] It is yet further appreciated that a function of VGAM546 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM546 include diagnosis, prevention and treatment of viral infection by Peanut stunt virus. Specific functions, and accordingly utilities, of VGAM546 correlate with, and may be deduced from, the identity of the host target genes which VGAM546 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7608] Nucleotide sequences of the VGAM546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM546 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM546 are further described hereinbelow with reference to Table 1.

[7609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM546 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7610] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 547 (VGAM547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7611] VGAM547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM547 was detected is described hereinabove with reference to Figs. 2-8.

[7612] VGAM547 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Peanut stunt virus. VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7613] VGAM547 gene, herein designated VGAM GENE, encodes a VGAM547 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM547 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM547 precursor RNA is designated SEQ ID:533, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:533 is located at position 1186 relative to the genome of Peanut stunt virus.

[7614] VGAM547 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7615] An enzyme complex designated DICER COMPLEX, dices the VGAM547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM547 RNA is designated SEQ ID:3258, and is provided hereinbelow with reference to the sequence listing part.

[7616] VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7617] VGAM547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM547 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7618] The complementary binding of VGAM547 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7619] It is appreciated that VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM547 host target genes. The mRNA of each one of this plurality of VGAM547 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM547 RNA, herein designated VGAM RNA, and which when bound by VGAM547 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM547 host target proteins.

[7620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM547 gene, herein designated VGAM GENE, on one or more VGAM547 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7621] It is yet further appreciated that a function of VGAM547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of viral infection by Peanut stunt virus. Specific functions, and accordingly utilities, of VGAM547 correlate with, and may be deduced from, the identity of the host target genes which VGAM547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7622] Nucleotide sequences of the VGAM547 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM547 are further described hereinbelow with reference to Table 1.

[7623] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM547 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7624] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 548 (VGAM548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7625] VGAM548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM548 was detected is described hereinabove with reference to Figs. 2-8.

[7626] VGAM548 gene, herein designated VGAM GENE, is a viral gene contained in the genome of tomato leaf curl virus. VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7627] VGAM548 gene, herein designated VGAM GENE, encodes a VGAM548 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM548 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM548 precursor RNA is designated SEQ ID:534, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:534 is located at position 462 relative to the genome of tomato leaf curl virus.

[7628] VGAM548 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7629] An enzyme complex designated DICER COMPLEX, dices the VGAM548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM548 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM548 RNA is designated SEQ ID:3259, and is provided hereinbelow with reference to the sequence listing part.

[7630] VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[7631] VGAM548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7632] The complementary binding of VGAM548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM548 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7633] It is appreciated that VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM548 host target genes. The mRNA of each one of this plurality of VGAM548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM548 RNA, herein designated VGAM RNA, and which when bound by VGAM548 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM548 host target proteins.

[7634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM548 gene, herein designated VGAM GENE, on one or

more VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7635] It is yet further appreciated that a function of VGAM548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of viral infection by tomato leaf curl virus. Specific functions, and accordingly utilities, of VGAM548 correlate with, and may be deduced from, the identity of the host target genes which VGAM548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7636] Nucleotide sequences of the VGAM548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM548 are further described hereinbelow with reference to Table 1.

[7637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7638] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 549 (VGAM549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7639] VGAM549 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM549 was detected is described

hereinabove with reference to Figs. 2–8.

[7640] VGAM549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7641] VGAM549 gene, herein designated VGAM GENE, encodes a VGAM549 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM549 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM549 precursor RNA is designated SEQ ID:535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:535 is located at position 1399 relative to the genome of Leishmania RNA virus 1–1.

[7642] VGAM549 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7643] An enzyme complex designated DICER COMPLEX, dices the VGAM549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM549 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM549 RNA is designated SEQ ID:3260, and is provided hereinbelow with reference to the sequence listing part.

[7644] VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7645] VGAM549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[7646] The complementary binding of VGAM549 RNA, herein designated VGAM RNA, to host target binding sites on VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM549 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7647] It is appreciated that VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM549 host target genes. The mRNA of each one of this plurality of VGAM549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM549 RNA, herein designated VGAM RNA, and which when bound by VGAM549 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM549 host target proteins.

[7648] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM549 gene, herein designated VGAM GENE, on one or more VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7649] It is yet further appreciated that a function of VGAM549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM549 correlate with, and may be deduced from, the identity of the host target genes which VGAM549 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[7650] Nucleotide sequences of the VGAM549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM549 are further described hereinbelow with reference to Table 1.

[7651] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7652] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 550 (VGAM550) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7653] VGAM550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM550 was detected is described hereinabove with reference to Figs. 2–8.
